KLIPSUN
A NEW BEGINNING
I hate to bring up the economy (after all, it’s all we ever hear about anymore), but even during these hard financial times, a fresh start is possible. That’s what this issue of Klipsun is all about: “New Beginnings”—the challenges we face in our lives and how we start anew.

“New Beginnings” covers a wide range of stories, from life after injury and prison, to the struggles of being a transsexual or living as a refugee in an unfamiliar country. Starting anew can also create opportunities to grow and learn as individuals and as a community, including finding new ways to explore cultures or to research life-threatening disease.

This issue also marks a new beginning for Klipsun. We are only publishing one issue this quarter—a bigger issue with more stories for you to enjoy. In addition, we are increasing Klipsun’s online content by creating multimedia components that explore several fascinating stories. Take a look online at klipsun.wwu.edu to view these new installments.

I hope these stories and online clips provide you with inspiration during these difficult times. I hope you, too, can find a fresh start—a new beginning.

Thanks for reading,

Katie Dreke

The renowned 30-foot Seattle Post-Intelligencer (P-I) globe still slowly spins above the P-I building on Elliot Avenue, located along the waterfront in downtown Seattle.

As the globe revolves, the mounted red lettering reads, “It’s in the P-I”—a media mockery of what the publication was just a few short months ago.

Everything looks eerily ordinary at the P-I headquarters. The unmistakable words, “The Seattle Post-Intelligencer,” on the front of the building match the newspaper’s banner, which once ran across the top of the front page. The one standout difference, however, is the vertical red and white ‘For Lease’ sign in the shadow of the globe—an evident symbol that the P-I has become yet another victim of the current economic crisis.

March 17, 2009 will stand out in the hearts and minds of people across the Northwest as the day it all ended—the P-I’s last date of publication.

With America’s newspaper industry struggling, a slumping economy forced the P-I to stop publication. However, online journalism is providing a new beginning for Seattle area journalists to keep breaking the news.

The answer was a quick transition from print to online, coupled with substantial layoffs in every department. From more than 150 employees, approximately 20 remain with Seattlepi.com to continue gathering and publishing the news.

Yet for a determined group of former P-I employees, the answer to layoffs was to create their own opportunities: The Seattle Post Globe and another reporting group, InvestigateWest.

Seattlepostglobe.com is still in its preliminary stages. The organization made its online debut in mid-April 2009, about one month after the closure of the P-I. They featured stories on the Mariners’ home opener and the race for Seattle’s city attorney.

InvestigateWest also remains in the beginning stages, but the organization’s goal is to gain an affiliation with local universities, such as Western and the University of Washington. The organizations represent the new and innovative ideas former P-I writers, editors and photographers are now working on in order to continue their careers in the ever-changing journalism world.

**FINDING MY RELIGION**

writer BECCA RAYNER

Under the arched ceiling of the church, Western junior Julie Lynch—one of more than 100 students meeting for Tuesday night service—bows her head. In the dimly lit pews, she closes her eyes and claps her hands together under her chin as she sings, wearing her headphones with the voices of those around her.

Lord, we are breathing the breath that You gave to breathe to worship You, to worship You. And we’re singing these songs with the very same breath to worship You, to worship You.

Her bright red hair catches in the light of the candles flickering along the edges of the room. She brings her hands in front of her chest as she sings—palms facing toward her fingers stretching toward the ceiling. Around her, others sit and sing while some hug friends nearby. In the balcony, one man spreads his arms wide, his fingertips outstretched as his voice joins the chorus.

It was a night like this, two and a half years ago at The INN, a Christian non-denominational ministry group, that sparked Lynch’s rediscovery of her faith. During the service she had a “this is it moment”—what some call a “spiritual birthday.”

The INN University Ministries is one of 16 religious Associated Students clubs on campus. As students reach college and are faced with choosing classes, majors and friends, some find their spirituality is another question to ponder. As they enter a largely secular campus, some students will re-examine their faith and its current place in their lives. Some explore and advance in the faith they have grown up with, some seek out new religions to try, and others discontinue and abandon their faith.

Art, culture, a willing community and decades of planning. Relentless, unwavering perseverance. This is what it takes to create the Bellingham Arts District.

Twelve years ago, representatives and board members from the Whatcom Museum of History and Art, Bellingham Public Library and Mount Baker Theatre sat in the corner of a dimly lit Pepper Sisters restaurant to discuss the future of art and culture in Bellingham. As the half dozen men and women dined on southwestern-style burritos and enchiladas, they hashed out the best way to develop a city center focused on the arts.

Two hours and countless rounds of tortilla chips later, those few progressive thinkers planted the seed for the Bellingham Arts District.

Ken Culver, a tall, distinguished man with graying hair and mustache, was one of the original visionaries present at the downtown restaurant that night, and continues to be personally invested in the project.

Culver says the group dreamed of a place in town where the young and the old, the artist and the art enthusiast, the creative and the creative at heart could meet and mingle to discuss, appreciate and contemplate the arts.

Without an abundance of culturally rich activities, a city can become devoid of creative thought and progress, and stops living up to its full, sophisticated potential, Culver says.

For Culver, the Arts District would include beautifully paved sidewalks lined with vegetation and pedestrian-friendly streets to promote both walking and driving. Music from outdoor concerts would travel through alleyways and accompany chatter of those emerging from theater shows and performances. Culver says the district is not about creating new venues, but giving the old spaces a rebirth by connecting them together.

“The arts bring a dimension to this town that any town would die to have,” Culver says. “We have the theater, a world-class museum and a great library system. They are all sitting within two blocks of each other, so why don’t we package this up into a physical, geographic location and call it the Arts District?”

This downtown revival is a collaboration between the City of Bellingham and Campaign for the Arts. Places such as the Whatcom Museum, Mount Baker Theatre, Pickford Cinema, Allied Arts and the American Museum of Radio and Electricity will be linked through the Arts District.

Culver says the district was only dreams and conjecture before city funding arrived—when they were finally able to put their plan into action.

The Bellingham-Whatcom Public Facilities District was created through state legislation in 2002 to provide approximately $17 million to the Arts District project over 25 years, but this was still not enough to make the district come

Campaign for the Arts fundraising opportunities when they did, Sundin

Sundin says. “I see this as a really vibrant, active district with a lot of potential,

Culver and Leach agree. Campaign for the Arts still needs to raise

another $3.1 million to keep the Arts District’s grand opening

Leach becomes lost in her own thoughts.

“All these projects take time,” Leach says as she peruses around her

office overlooking Bellingham Bay. She adjusts her stylish, black-rimmed

glasses and adds, “They never happen when you think they are going
to happen. They always take longer.”

Construction of the museum’s new facility was scheduled to be

complete in April 2009, but Leach says it will take at least another

months of planning, building and fundraising to get the Lightcatcher

building up and running.

To Leach, the completion of the two-year project signifies not only

a new building, but also a new way of life for the community.

She says she hopes the render, modern museum building will attract

“Bellinghammers” of all ages. She says her biggest hope is people will

peruse cafes, restaurants, theaters, gallery walks and exhibitions opening

on a nightly basis in the Arts District. Especially when money is tight,

she says.

“I see this as a really vibrant, active district with a lot of potential,”

Leach says.

Culver and Leach agree. Campaign for the Arts still needs to raise

another $3.1 million to keep the Arts District’s grand opening on

schedule. The museum has its only fundraising event of the year planned

for July 2009 in the nearly-complete Lightcatcher building as a last ditch

tempt to attract donors, and continue to involve the community in the
district’s progress.

It is important for residents to see how much their contributions helped build this
district, Culver says. The project made it this far

because of the hard work of numerous people

and organizations.

Culver sheds his eyes from the evening

sun and looks out across the empty Light-

catcher building construction site. The project

has come a long way since its start at the Pepper

Sisters restaurant, and he can almost taste the

satisfaction of a successful venture. He says it

would be heartbreaking to see the project come

so far just to falter in the end.

Culver says he is unperturbed by any

economic hardships that threaten to thwart

the completion of the Arts District. Even if he

has to raise the remaining money one penny

at a time, he is determined to see this rebirth

through.

With the current economic climate making it nearly impossible
to begin such a large project, the city is lucky they took advantage of

Doctors took CT scans, but the only result of the room that night was the little pink dot. Dixey was not able to sleep that night. Forty-eight hours earlier, and the implications of the attack had already begun to compromise their business. At Swedish Medical Center in Seattle, who implemented a series of tests, Dixey’s case was also posted to an online tumor board where doctors discuss difficult or strange cases. There he was introduced to Dr. Ben Chue of Seattle. Dixey says he became interested in Chue’s opinion on his disease, and thought it would be worthwhile to schedule an appointment.

When Dixey’s tumor board was going on, Dixey went online and found a new treatment for bladder cancer that mixes the traditional drug used to treat the disease, Baccillus Calmette-Guerin (BCG), with interferon, a drug that helps raise the body’s immune system. Dixey presented this information to his doctor, who then began treating him with the regimen.

“By using the Internet, I get as many points of view as possible, and we were able to make educated decisions,” Dixey says. “I’ve lost three or four friends in the past five years because they didn’t ask questions and just went with what the doctor told them.”

Dr. David Lynch, president of the Whatcom County Medical Society and vice president of the Family Care Network, created FamilyCareNetwork.com out of his frustration with patients who ask no questions and just go with what the doctor told them. “When patients are in the [doctor’s] office at the time of diagnosis, the information sometimes goes right past them,” Hopper says. “They can get valuable information from the Internet.”

According to a study by the Pew Internet & American Life Project, 80 percent of American adult Internet users search for healthcare information online.

“There are a lot of credible sites out there,” Hopper says. “[Looking online] is helpful because it gives patients a little more voice to ask about their illness.”

Some Web sites are creating new opportunities for patients facing serious illnesses to have a say in the course of action that is taken to treat them.

Dixey says he found a Web site where a man, whose case was similar to Dixey’s, was discussing his experiences. He recommended an oncologist in Massachusetts, but Dixey was not able to travel to see the doctor. However, the man from the site did give Dixey some helpful advice. He said Dixey should use a team of doctors to fight his illness, including a surgeon and oncologist, who practiced traditional Western medicine, a naturopath and a doctor, who practiced traditional Chinese medicine. The man from the site said this team was able to save his bladder, giving Dixey a glimmer of hope.

Dixey’s case was also posted to an online tumor board where doctors discuss difficult or strange cases. There he was introduced to Dr. Ben Chue of Seattle. Dixey says he became interested in Chue’s opinion on his disease, and thought it would be worthwhile to schedule an appointment.

Chue thought Dixey’s organs could be saved.

Dixey says he and his wife did not stop researching the disease once his team of doctors was assembled. When it was time to start battling his disease, Dixey went online and found a new treatment for bladder cancer that mixes the traditional drug used to treat the disease, Baccillus Calmette-Guerin (BCG), with interferon, a drug that helps raise the body’s immune system. Dixey presented this information to his doctor, who then began treating him with the regimen.

“When I saw the seat, I just felt that something wasn’t right,” Dixey says. “My wife noticed that my mood had recently changed and I would go to bed early.”

But despite the cryptophan in the turley, Dixey was not able to sleep that night. Forty-eight hours earlier, and the implications of the attack had already begun to compromise their business. At the time, nothing seemed to be going well for Dixey.

“Torgerson closely examined the dark pathway to his bladder. It was only when the camera entered the cavernous organ that Torgerson saw what he feared—six cancerous tumors lining the walls of Dixey’s bladder.”

On the eve of 2002, when most are thinking of the fresh start the new year will bring, Torgerson called Dixey to give his prognosis. He and his wife began to gather as much information as they could effectively searching online to get the information we needed.

“I was shocked at first and then kind of angry because I felt that no one really cared. You can get a lot of information from the Internet for free,” Dixey said.

McCall says looking to blogs for others’ experiences helped her to be more observant of her environment and what went into her body. She says increased awareness of the information online, and the story Dixey shared on the cancer and chemotherapy, she would research what others were saying about the symptoms.

Millions of health related Web sites discussing just as many opinions are posted to sources worldwide, which Dixey says is a benefit of researching online.

“My wife and I wouldn’t have been able to learn as much as we did without the information we found online,” he says.

Dixey says his oncologist was initially skeptical about the team of doctors Dixey heard about online, but when he saw the positive outcome of Dixey’s treatment, he started recommending the same treatment for other cancer patients.

Both Dixey and McCall bared their diseases with information, and the doctors today are beginning to refer patients to Web sites to help them learn about what they are facing. Looking online may soon become doctor’s orders.

The information sometimes goes right past them,” Hopper says. “They can get valuable information from the Internet.”

A SNAPSHOT OF WHAT’S OUT THERE

+PATIENTSLIKEME.COM
Healthcare’s version of social networking. More than 33,000 patients add friends, and post information and support about their illnesses. The site also features news on research and improvements in the medical field from doctors and scientists around the country.

+MAYOCLINIC.COM
Covered information on over 3,000 diseases and conditions. The site also provides information from more than 3,000 doctors and researchers. It also provides news updates on the latest health conditions.

+MEDLINEPLUS.GOV
Contains information from the U.S. National Library of Medicine, and the National Institute of Health. According to the site, MedlinePlus features “extensive information about drugs, an illustrated medical encyclopedia, interactive patient tutorials, and latest health news.”

+FAMILYCARENETWORK.COM
Contains information from doctors in the Family Care Network, a team of Whatcom County-based, board-certified physicians. The site provides medical information to those who specifically live in Whatcom County, including doctors and clinics in the area, recent medical news and tips to old common ailments.

+WEBMD.COM
In 2007, an average of 17.1 million people per month visited this site. It features a ‘Symptom Checker’ as well as A-Z information on an array of illnesses and diseases. According to the site, posted information is reviewed by a medical board consisting of four physicians.

TIPS FOR SEARCHING ONLINE FOR MEDICAL INFORMATION

+SEARCHING FOR MEDICAL CONDITIONS
through a common Web site may lead to less than credible results. Try searching on EBSCO’s search engine run by the National Library of Medicine, or healthfinder, an engine that searches through government health Web sites.

+FIND BLOGGERS OR FORUMS
that primarily discuss the condition you have. Information from someone who has experienced the treatment of a particular disease or illness is helpful because it is delivered first-hand. Something that worked for another individual may also work for you.

+MEDICAL JARGON
can sometimes be difficult to understand. The Medical Library Association Web site features “Deciphering Medspeak,” a resource that translates medical jargon, making it easier to understand.

+ASK YOUR DOCTOR
before trying anything. Web sites are great places to look for information, but before trying someone’s home remedy, you should discuss it with your physician. Certain foods or drugs may counteract with prescription medicines, so getting your doctor’s permission is a must.
Within minutes of meeting Buelow and Rhea at the library, Meyer assured them they could pack their tent away—they could crash at his apartment. No charge.

"He pretty much gave us the keys to his apartment on the spot and was like, ‘Oh, yeah, you can totally stay with me—I'll meet you back there in two hours,’” Rhea says.

The two friends slept in Meyer’s living room for the next three nights. They made pizza with him, partied with his friends and visited places around the city based on his recommendations. Overnight, Buelow and Rhea’s first couch surfing experience jump-started their love for a new method of travel, introducing them to roughly 100 individuals across the globe and giving them new perspectives on other cultures they could not gain without staying with locals.

“You meet people from a lot of different backgrounds,” Buelow says. “You become familiar with this whole new international community so quickly.”

That international community consists of more than 1 million couch surfers from almost every country on Earth who use Web sites like CouchSurfing.com, HospitalityClub.org.

Two years ago, Western junior Lara Buelow and her roommate, Randolph Rhea, huddled and shivered in a cramped, smelly tent they had pitched in a patch of woods beside an old cemetery. All night rain pummeled their tent while a dull, 24-hour sunlight suffused it through its fabric, waking them every hour or two. They had no place to stay. They were miserable. They were two American students visiting the arctic tip of Norway.

Days before, Buelow, 22, and Rhea, 21, embarked on a dream trip from northern Sweden up to the city of Tromsø, Norway. Though they had little money between them and no semblance of an itinerary, two free weeks of summer vacation in Europe was reason enough to venture out.

After days of riding trains and nights of camping in national parks, the friends finally reached Tromsø: the place where the dream trip gave way to a reality check. The city hostel would not open for another month, no hotels fit their price range and they knew no Norwegians. Despite it being May, Buelow and Rhea still noticed snow on all the surrounding mountaintops when they wandered into the drizzling woods near the city limits to set up camp.

Thankfully, the next morning, they met Scott Meyer.

Compelled by fantasies of sleeping some place warm and dry, Buelow and Rhea walked to the Tromsø city library that morning to use a Web site Rhea had recently learned about—one where hospitable locals from all around the world offer their couches to travelers who need a place to sleep. There, at CouchSurfing.com, they contacted Meyer, a Tromsø resident and seasoned couch surfer.

“Scott instantly became our savior,” Buelow says.
and GlobalFreeloaders.com to stay with locals during their travels. With the global economy suffering in recent months, the community has grown at an exponential rate. In April 2009, an average of 14,000 new couch surfers registered with CouchSurfing.com each week, nearly doubling the growth numbers from April 2003, which also had doubled from the previous year. Approximately 300 people in the Bellingham area are now registered couch surfers—many of them Western students.

Bulman and his partner of 28 years, Jim Rich, have hosted more than 20 travelers in their Bellingham home, sparking long-lasting friendships. "It's a super economical way to travel, but it's more so a wonderful way for us to make friends in another country," says Bulman. "It's strengthened our relationship—absolutely. You experience it and you have to agree, 'OK, we want more of this.' We usually go to sleep at night and talk about how great it's been."

One of the couple's most memorable guests was a Japanese man who flew from Tokyo to Los Angeles and brought a bike that he pedaled up to Bellingham, couch surfing along the way. "It requires you to communicate with each other to make it happen. We've never really found anyone who just comes over and wants to be a slob. They always want to cook. They always want to do dishes or help out around the house," Bulman says. "Most people have very little to do with monetary savings. It's a lot of personal gain."

"Pushing your comfort zone can make the world feel like a whole new place," says Lara Buelow's sister, Maya, who travelled in Greece during spring break 2009 in Greece. He and a friend arranged to meet their host at a metro station in Athens and he remembers feeling a rush of anxious anticipation as they waited to meet the stranger whose couch they would sleep on.

"We were just waiting and going, 'Oh my God, what are we doing? Are we crazy? This is ridiculous,'" he says. "But soon enough, he rode up on his moped with a big smile, and after the initial formalities, we knew he was going to be a lot of fun."
SEEDS OF COMMUNITY

ABOVE
Bee Laverne, 56, cooks in a
door-floor apartment with
no pain and is happy to have
a place to live in a garden.

Past the new development issues and
condominiums at the north end of Whatcom
County, the wide, smooth paved street turns
into a lumpy, freshly gravelled road. The road
leads to a large fenced area in the middle of a big
grassy field surrounded by tall fir trees, distant
mountains and the endless blue sky.

Inside the 8-foot-tall fence are a dozen
people too busy to take notice of the picturesque
surroundings. Fifty wooden, raised garden beds,
each measuring 4-by-16 feet, sit waiting to be
filled with rich, dark soil, and volunteers will fill
them one wheel-barrow at a time.

Piled high are huge drum-stuck loads of
soil. Just inside the fence near the work
shed are boards, plastic buckets, coiled hoes,
takes, shovels, trowels, tools of ware fencing
and sheers of cardboard. All these materials,
combined with the sweat of volunteer labor
and a tracing planting session by the Guide
Meridian/Cordata Neighborhood Association,
are transforming the once empty field into the reality of Cordata Community Gardens—a 16,000-square-foot nonprofit
garden space open to the public.

An electrical cord snakes out of the work
shed running to the end of the drill in 72-year-
old Ben Andrews’ hand. Andrews, one of the
garden organizers, is up on a ladder, and Bill
Smith, a Washington State University Master
Gardener and official consultant for Cordata
Community Gardens, is standing boards that
will fit above the smaller walk-through entry
gate.

“I’m just not sure if we can make our start date on May 1, 2009,” Andrews says. “We don’t have warm look-up yet, and the beds aren’t ready for planting. But we are trying for it because people are wanting to get on with it.”

People all across the country are “wanting to get on with it.” The recent headlines about the economic crisis, tainted food and poor nutrition have helped inspire a sense of urgency in transforming the Victory Garden idea of the Eleanor Roosevelt era to the Community Gardens of today. Growing one’s own food has even taken on a social justice aspect. Gardening can be a way to make a political statement about inequities in the U.S.’s current troubled food system.

“Change is coming to food,” says Sara van Gelder, editor of YES! Magazine. “As the global economy unravels, and as the implications of peak oil and climate change sink in, interest in alternatives to the current food system is growing. People are reconnecting with the land and with community.”

Ben Chester agrees with van Gelder’s idea about the importance of developing alternatives to the present system of agriculture. Chester, a 26-year-old Western alumna, majored in philosophy and has studied permaculture gardening. He divides his time between Seattle and Bellingham, volunteering with another new community garden in downtown Seattle.

“People are wanting to get on with it,” Shah says. “I got used to eating fresh, locally grown food. Almost everyone grows food and cooks at home today.”

Shah has never gardened before, but when she found out about the Cordata Community Gardens she could not wait to sign up. The economy crisis also inspired her to try growing her own food, as the jump in food prices was shocking to her when she returned from Spain. Produce prices can be two or three times more expensive in the U.S. as compared to Europe, Shah says.

“Although Andrews is the driving force behind the creation of Cordata Community Gardens, they say the garden is the result of countless hours of volunteer effort and advance planning from many community members.”

The Andrews have been living in Bellingham for the past three years, and hope to start four more community gardens in north Whatcom County to satisfy the huge demand for gardening spaces.

Ben Andrews says he sees community gardening as a way for people to prepare for coming social changes brought on by economic and environmental issues.

“We need to rethink how to feed ourselves with quality food,” Ben says, with a slight southern accent.

At the Washington State University Whatcom County Extension Service office, Master Gardener Jill Cotton says the recent surge of interest in gardening is being driven in part by the current recession.

“My phone has been ringing off the hook with people asking for help with starting a garden to supplement their food budget,” Cotton says.

Cotton says the implementation of the new Whatcom County Extension Service program, called Community First/Gardens, could not come at a better time for Bellingham residents. The program offers help in the form of matching funds of $5,000 to approved applications for neighborhood community gardens.

The Cordata Community Gardens is the first recipient of a $5,000 grant from the Mary Redman fund affiliated with the Community First/Gardens Project. These kinds of gardens offer affordable garden plots, tool, community support and education from master gardeners for beginning and advanced gardeners.

A community garden can serve as a gathering place for diverse neighborhood residents. The gardens are known for their “backyard get-togethers,” seed exchange parties, and education seminars, which are held at community garden sites.

Studies have shown community gardens create social benefits, in addition to economic, nutritional and environmental issues that are facing our families.

“One of the main themes established by research is that community gardens act as a catalyst for community building,” says Andrew Walter, who has a Master in Landscape Architecture. “The combination of the public and the participatory nature of community gardens increases social contact between people, and thus helps build a sense of community.”

Shah tells two of the volunteers she is already having visions of all the gardeners getting together to have a “Mid-Summer Nights Dream” party at the garden.

“These gardens can inspire you to think of these things: get going, and you are just pulled into it,” Shah says.

Though the Cordata Community Gardens did not make their opening date, the Andrews say they are not worried; the seeds of a growing community have already taken root.
TOP PICKS

Master Gardener and official consultant for Cordata Community Gardens, Bill Smith, says with careful planning, a 14-by-16 foot raised garden bed can easily feed a family of four during the growing season. Here are Smith’s plant recommendations:

Laying on his bed at Bellingham’s Aloha Motel on Samish Way, Department of Corrections inmate 971030 claps his bald head and furrows his brow as his mind drifts back to the prison cells he spent years living in.

The gates in his mind crank open and memories flood forth: the tiny cells, the hour to shower, the hour outdoors, the fights with other inmates and the days spent in solitary confinement as a result. An alcoholic and drug addict, he was sentenced to three and a half years in prison in 2001 for kicking in the door of his trailer on the Muckleshoot Indian Reservation, which he was sentenced to three and a half years in prison in 2001 for kicking in the door of his trailer on the Muckleshoot Indian Reservation and threatening to kill his girlfriend because he thought she was unfaithful. He stayed seven years, picking up more charges—and years on his sentence—because of the fights.

Mary Christmas, 2008."

Heddrick says. "And for the next 16 months, he considers this a blessing because he knows who he was before prison. He has faced 40 criminal charges in his life—an average of more than one charge per year lived.

"When you look at my criminal history, I look like an animal," Heddrick says. "More importantly for Heddrick, however, are the eyes that keep watch on him. As part of his sentence, the Washington State Department of Corrections (DOC) has a community corrections officer monitor and test him to ensure he is staying away from drugs and alcohol. Heddrick is also a bipolar schizophrenic and cannot work until he has progressed enough with his mental-health treatment. His community corrections officer ensures he gets his antipsychotic medication injected every two weeks.

Heddrick is one of approximately 34,000 men and women in Washington under active DOC supervision. Although he will be watched for the next 16 months, he considers this a blessing because he knows who he was before prison. He has faced 40 criminal charges in his life—an average of more than one charge per year lived.

"When I got to prison, I had some real convictions and imprisonments provided the best chance for him to break free of the criminal justice system, says his community corrections officer, Eric Petersen.

However, the odds are against his success. According to DOC estimates from 2006, of the more than 8,000 offenders released from prisons in Washington every year, a little less than half will return for a new conviction within five years.

If Heddrick is monitored and has access to mental-health treatment, his chances of success in his new life improve, according to a 2006 study from the Washington State Institute for Public Policy. The study found that when mentally ill offenders were given monitoring and treatment, the number returning to prison on new convictions dropped by 20 percent.

"They need that supervision otherwise they would be cycling back to the system constantly," says Nathan Bajema, a community corrections officer in Bellingham.

The story of Steven Heddrick’s life outside of prison intertwines with worry over the poor economy. He once owned a contracting company on the Muckleshoot Reservation, Heddrick’s Hammer Construction, but lost it when he went to prison. He would like to get it back and ventures out only to go shopping, smoke cigarettes or go to meetings and treatment sessions. Along this strip of Samish Way, drug use comes with the neighborhood. Heddrick says, "I pretty much stay to myself."

Now that Heddrick is a free man, the government that arrested, convicted and imprisoned him provides the best chance for him to break free of the criminal justice system, says his community corrections officer, Eric Petersen.

However, the odds are against his success. According to DOC estimates from 2006, of the more than 8,000 offenders released from prisons in Washington every year, a little less than half will return for a new conviction within five years.

Heddrick says, "I pretty much stay to myself."

"I'm worried about what's going to happen," Heddrick says. "I have this big, eight-year hole in my resume. The problem is that the economy’s so bad right now. There aren't a lot of jobs out there.”

Heddrick gets anti-psychotic injections at a clinic on Semmes Drive twice a month, and he hates it. The injection makes him anxious and cause him to pace around his motel room. As much as he hates the medication, he acknowledges it’s an important part of his new life.

He went to prison believing he was not mentally ill. Heddrick says he went crazy in prison, fighting younger inmates he believed were threatening him and were part of gangs. Although the medicine makes him nervous, he says he is less prone to violence.

"It gets me a real bad feeling. It doesn’t mix with my system," Heddrick says. "But you never know, maybe I do have some kind of mental disorder.”

Determined to stay clean and sober, Heddrick shut himself in his motel room and ventures out only to go shopping, smoke cigarettes or go to meetings and treatment sessions. Along this strip of Samish Way, drug use comes with the neighborhood. Heddrick says, "I pretty much stay to myself."

"When I got to prison, I had some real time to think about my life. I had my eyes closed," Heddrick says. "Prison opened my eyes to what life is all about."

More importantly for Heddrick, however, are the eyes that keep watch on him. As part of his sentence, the Washington State Department of Corrections (DOC) has a community corrections officer monitor and test him to ensure he is staying away from drugs and alcohol. Boulevard Park that she did not keep.

had to watch the Fourth of July fireworks at

on his hot plate in his room and the plans they

for money, he allows himself to reflect.

Lathrop would walk up and down Samish Way

room smoking a cigarette and looks at where

badly it took months to identify her.

evidence of her murder mutilated her body so

on until mid-July, when she went missing. Her

prison—Lathrop and Heddrick dated o

in March 2008—when she was released from

pauses after saying Shannon Lathrop's name,

one's baby.

She was a really lovable girl even though she was crazy,” Heddrick

dsays. “It just made her seem more vulnerable. Shannon was like every-

one's baby.

And with that, Heddrick's troubled mind cranks forward and he

begins talking about jobs, kids and his future once he leaves DOC

supervision.

Forty-eight million dollars—that is how much the state govern-

ment will save taking its eyes off of people cycling through its criminal

justice system. To Eric Petersen, a Western graduate who has worked

with the DOC for 12 years, laying off community corrections officers

is offensive.

“They look great on paper,” Petersen says. “But it’s going to

hammer the local communities. We see the people who would be cut

off.

The DOC provided Lathrop with her room at the Aloha Motel and insured she was complying with her court-

ordered mental-health treatment, Reid says. She was set to

draw her supervision in the last week of July 2008. Before her

death, her mental state was improving and she told Reid at

their last meeting, July 16, she wanted to stick with the treat-

ment so she would not have to return to the mental hospital.

Reid says Lathrop's supervision with the

DOC had improved her life. She had progressed so

much she was seeking volunteer rights to see her son,

whom she gave birth to in jail, Heddrick says.

Lathrop called Reid obsessively—sometimes more than

30 times a night. But suddenly, the calls stopped, and Reid knew

something was wrong. On July 21, Reid knocked on Lathrop's motel

door, but no one answered. On July 23, Reid filed a court notice

to confirm her worst suspicions.

Lathrop's mind. Alone in her motel room, Lathrop would sometimes

scream so loud neighbors would call the police convinced she was

being murdered, Reid says. When an officer arrived, Reid says,

Lathrop would answer the door calmly, unaware of her outbursts.

"It must have been awful living in her

mind," Reid says. "In her mind she was terrified."

Lathrop called Reid obsessively—sometimes more than

30 times a night. But suddenly, the calls stopped, and Reid knew

something was wrong. On July 21, Reid knocked on Lathrop's motel

door, but no one answered. On July 23, Reid filed a court notice

and Reid was addicted to methamphetamine, he regularly fired into her bloodstream.

For much of her adult life, Lathrop bounced back and forth from Bellingham, Spokane and mental hospitals, says her community corrections officer, Jeri Reid. Reid supervised her for years, and says at times Lathrop truly believed someone was out to kill her. Reid says she was sometimes delusional but played out her voices inside Lathrop's mind. Alone in her motel room, Lathrop would sometimes scream so loud neighbors would call the police convinced she was being murdered, Reid says. When an officer arrived, Reid says, Lathrop would answer the door calmly, unaware of her outbursts.

"It must have been awful living in her

DOC had improved her life. She had progressed so

much she was seeking volunteer rights to see her son,

whom she gave birth to in jail, Heddrick says.

Lathrop called Reid obsessively—sometimes more than

30 times a night. But suddenly, the calls stopped, and Reid knew

something was wrong. On July 21, Reid knocked on Lathrop's motel

door, but no one answered. On July 23, Reid filed a court notice

and found a match. A detective called

Reid to confirm her worst suspicions.

"We knew something had

happened to her," Reid says. "It's sad

that she died a violent death. Hopefully

she's in a more peaceful place."

Heddrick says detectives came by his room several times to question him about Lathrop's disappearance and have him try to identify male suspects from a

photo line-up. The problem, Heddrick explains, is Lathrop was also a prostitute

and spent her nights with many men.

Shannon Lathrop's life is now contained in manila folders belonging to the Whatcom County Sheriff's detectives and FBI agents tasked to find and arrest her killer.

Lathrop never had the chance to experience life outside the
criminal justice system. She was at the cusp of finally breaking her life free of the
system, but someone intervened and cruelly ended it.
As her date circles the perimeter of the construction Dumpster, Jen Girard inconspicuously climbs up the ladder and into the commercial-streel bin.

“Oh my God, you got in!” exclaims her date. Girard, a trash designer from Seattle’s Ballard district, often rescues reusable trash from Dumpsters to make garments. She was one step further on Feb. 1, 2009 when she asked her date to help her find trash on their second outing. Dressed in stylish clothing—albeit warm with five layers, to protect herself in the middle of winter—Girard met up with the lucky man.

The cold February weather hit the two hard in the enclosed space. The large metal bin trapped the cold winter air and made her glad to have worn a down vest, hat, and scarf, she says. After an hour of rummaging through the Dumpster, Girard finds enough items to begin her design, including orange construction fencing and three pieces of Holly Hansen rain gear. She donated a quarter of her findings to Goodwill—items such as burger cords and unopened tools that were perfectly usable—and used the rest to fashion a garment.

“There’s something about being in a Dumpster that makes me ask ‘How do I make this into fashion?’” Girard says.

Six weeks later, on April 11, 2009, wearing a black “Be the Change” T-shirt, the petite, redhead designer showed off the new life she gave to the trash she found on that chilly day in Ballard. Girard, who chose the designer name “Remera Plariqua,” attended the eighth-annual Recycled Art and Fashion Show at Wild Buffalo in Bellingham, organized by the city’s RE Store.

A yellow raincoat cascades over the back of the skirt. Two melted vinyl records form the bustier, giving the upper half of the garment a sti, shiny look. A wig, fan and a broken glass necklace complete the classic Marie Antoinette look titled, “The Ballad Ballroom.” Girard was victim to many hot-glue gun burns during her six weeks of making the gown, which she constructed in the evenings and on Saturdays. Her friend and fellow designer, Tamara Adlin, turned to gardening gloves as protection from the scorching glue. One look at the gloves shows every finger covered with dried and hardened glue, even after three different de-gluing sessions.

The idea of the trash fashion movement is to take items that cannot be recycled and rework them to give the items a new beginning as a work of art, says Robin Worley, a designer for Haute Trash.

Haute Trash, a trash fashion organization taking its name from Haute Couture, was established in Nevada City, Calif., and now has satellite groups in cities such as San Diego, Seattle, San Francisco and Bend, Ore. Yearly fashion shows encourage designers to search for non-recyclable items and reusable trash to convert into runway wear.

Each week, a 9-mile long train leaves Seattle on its way to discard the city’s trash in Eastern Oregon, Worley says.

More than half of the garbage that occupies U.S. landfills is packing materials, and of that percentage, half is paper that could have been recycled, she says.

Worley, who has friends in Europe, says the system in the population-dense continent is better than U.S. recycling procedures, as European manufacturers are responsible for packaging. A European consumer can purchase a product and leave the packaging at the store, giving the burden of discarding the packing materials to the producer.

Trash fashion allows what would otherwise sit in a landfill to be given a new life. Worley, whose designer name is “Rayona Visqueen,” says she often sits on the bus and scopes out future projects.

“I look at backpacks and I think ‘That looks like it’s falling apart; it would make a top,’” she says. Rebecca Maxim, a nurse whose designer name is “Alottdetritus,” has shown her design in five shows and now considers herself part of the trash fashion community. She says creating garments from trash is a growing trend and was initially done by a small group of designers in California.

Three days, people as far as Great Britain and New Zealand are involved in trash fashion, as seen in the yearly Trash to Fashion awards in Bend, Ore. Yearly fashion shows encourage designers to search for non-recyclable items and reusable trash to convert into runway wear.

“I consider myself a nurse, not an artist,” she says. Trash fashion has become so widespread that a few garments for Bellingham’s fashion show came from San Francisco and London.

Maxim traveled to Mexico, Patagonia and Nepal, and noted Americans throw away much more than other countries.

Hoping to collect foreign trash for future creations, Maxim took a great interest in unrecyclable items found in Mexico. On her trip to the Yucatan Peninsula, she was told the trash that was washed up on the beach came from African freighters and traveled hundreds of miles through Atlantic currents. Unfortunately, the trash had degraded too much for Maxim’s interest.

She says Nepal’s trash collection system was nearly nonexistent when she traveled to the Asian country, yet the amount of trash was not as high as in the U.S.

Jason Darling, education and marketing coordinator of the RE Store, says Nepal already consumes less than the U.S., and what people do not use they feed to their animals, including fruit rinds.

As her date circles the perimeter of the construction Dumpster, Jen Girard inconspicuously climbs up the ladder and into the commercial-streel bin.

She says Nepal’s trash collection system was nearly nonexistent when she traveled to the Asian country, yet the amount of trash was not as high as in the U.S.
Instead of dumping reusable items into landfills like Americans, people in Nepal pick through trash until what is left is no longer usable, Darling says. For example, plastic bags, the country's most common pieces of trash, are swept and burned to keep warm in the cool mornings, despite the dangerous fumes given off by burning plastic, he says.

The U.S. is quick to bury its trash in dumps, leaving few opportunities to pick through to procure reusable items. Every Dumpster holds reusable goods, Darling says.

For years, Darling rummaged through Western's Dumpsters at the end of the school year to find reusable items students threw away before the start of the summer. He says throughout the years he has found a leather jacket, a working car stereo and shoes.

Western senior Ben Weiser, who has worked with Western's Recycling Center since 2006, says the center adds recovery barrels to residence halls a couple times a year to reduce the amount of reusable goods disposed of by students.

The barrels are set out in the winter when Asia University America Program students leave Western, as well as after spring quarters. The items collected by the barrels are donated to charity, Weiser says.

Throwing away used goods is a relatively new concept, Darling says. Americans have been wasteful for the past 50 years because it was economical and easy to throw things away.

Corporations started producing goods to make money by building short-lived products that would need to be replaced frequently, which caused the volume in the landfills to grow, Darling says.

In some instances, the trash does not find its way to landfills. Worley says she is appalled when she finds out new information regarding trash. For example, ocean currents in the Pacific Ocean transport floating debris to a central location, forming what is known as the Great Pacific Garbage Patch, Worley says. "The garbage patch is rumored to be twice the size of Texas or as large as India," she says.

"We are all part of the problem," she says.

Girard is just one person who has embraced the trash fashion trend as a way to reduce waste and says the fashion shows give light to how much people throw away.

Once garments like Girard's have had their one-year runs in fashion shows, they are either shipped to other locations to appear in various shows, placed in a large storage facility in California where Haute Trash began, or stored in the recesses of Worley's living room.

Girard plans to make new garments to enter into fashion shows in fall 2009. "I have ideas," she says. "I just need to go Dumpster dive—to replenish supplies."

She says the material she finds on her trash expeditions determines the design of the garment since the trash is difficult to work with. But, she would like to see trash made into more big dresses and headresses.
On Sept. 7, 2008, the leaves were beginning to change their green for gold. The sun was out and the sky was such a deep blue that the atmosphere seemed within reach. It was a perfect day for a bike ride.

Friends Seth Keeghan and Kevin Candela were nearly finished with the 30-mile loop they had ridden around Lake Padden. They were on their way back into town, riding downhill on Connelly Avenue, which becomes Old Fairhaven Parkway after the I-5 overpass. They never made it onto the parkway.

Riding their road bikes at 25 mph, the two friends zoomed down a hill they had ridden down hundreds of times before. It was 2:30 p.m. and traffic was heavy. Hands on their brakes, they studied the traffic, relying on their brakes, they studied the traffic, relying on their

It was such an incredible, ‘Pow!’ sound,” Candela says. “The first thing that went through my mind was, ‘Fuck, he’s dead. I just saw my best friend get killed.’”

Keeghan hit the SUV, leaving a massive dent in the front panel. He and his bike flipped into the air and landed on the windshield, smashing it. He bounced off the hood and hit the pavement facedown. Candela watched his friend contort in pain, and then become rigid. Keeghan’s eyes were open unnaturally wide, and his arm was bent and folded beneath him. He was unresponsive and not breathing.

Candela and the man who was driving the SUV tried to turn Keeghan over to administer CPR, but when they grabbed his shoulder, Keeghan regained consciousness and emitted a sound of pure agony.

“We were watching his friend contort in pain, and then become rigid. Keeghan’s eyes were open unnaturally wide, and his arm was bent and folded beneath him. He was unresponsive and not breathing.”

“It was this incredible, ‘Pow!’ sound,” Candela says. “The first thing that went through my mind was, ‘Fuck, he’s dead. I just saw my best friend get killed.’”

Keeghan was wearing a helmet. Like many accident survivors, Keeghan would rely on physical therapy to regain the motor skills he lost on that fateful summer day. Physical therapy does not always guarantee patients will fully recover. A patient’s attitude and goals for recovery play a big part in how effective the therapy is, and 90 percent of trainers agree that it is important or very important to treat the psychological aspects of injuries, according to the book “Foundations of Sport and Exercise Psychology” by Robert Stephen Weinberg and Daniel Gould.

Keeghan has gone through many ups and downs, but in the beginning of his recovery it was mostly downs.

“During his second stay in the hospital, he was walking through the halls in his robe, looking out the windows. It was such a beautiful day,” Keeghan says. “I stood there at the window and I just started crying.”

He was only out of the hospital for a week and a half when his left shoulder fell out of its socket. Because he just had surgery on his forearm, his friends and family were wary to push him back in for him, so he went back to the hospital. When the doctor pushed Keeghan’s arm back into the socket, he felt instant relief.

“I was so fed up with the pain,” he says. “I’d just gotten out of the hospital and I was already back in there.”

According to the Bicycle Helmet Safety Institute, about 540,000 bicyclists visit emergency rooms with injuries each year. Luckily, Keeghan was wearing a helmet. Like many accident survivors, Keeghan would rely on physical therapy to regain the motor skills he lost on that fateful summer day. Physical therapy does not always guarantee patients will fully recover. A patient’s attitude and goals for recovery play a big part in how effective the therapy is, and 90 percent of trainers agree that it is important or very important to treat the psychological aspects of injuries, according to the book “Foundations of Sport and Exercise Psychology” by Robert Stephen Weinberg and Daniel Gould.

The key is that they know you really care about them as a person—not just their injury, but how they're doing in school, at work, in their relationship,” deKubber says. “You need to be concerned about the whole person and you’re gonna have a better response.”

Keeghan began half-hour sessions twice a week at Bellingham Physical Therapy. After a few weeks, he moved up to three times a week. Although he alternated between three different therapists, MacLean was his favorite because she was tough. She brought the pain threshold on, but studied his facial expressions and knew what he was capable of handling.

“I like her better than any other just because she pushed me so hard,” Keeghan says. “The more you can handle, the more quickly you can recover.”

MacLean says Keeghan’s diagnosis was special, and that because of his “frozen shoulder,” it was important to push him hard to break through the scar tissue.

One of the exercises he performed included him lying on his back while a therapist raised his arm over his head. The horrible one, Keeghan says, was when he would lie on his back and rotate his arm out with his elbow still touching his side.

Keeghan also had a pulley system over his bathroom door at home. With his good arm he would pull one handle down while hanging onto the other handle with his bad arm to gain a better range of motion upwards.

When he started physical therapy, Keeghan’s arm only had 11 degrees of mobility instead of 180 degrees. The latest measurement was 135 degrees of mobility.

In May 2009, he went in for surgery to scrape away scar tissue from around his shoulder. Then it was back to more physical therapy.

“I just want to get my whole self back,” Keeghan says. “Anything other than normal is not good enough.”

Generally, people who have sustained injuries feel more gratitude about what they are able to do after recovery, whereas before the accident they may have taken their abilities for granted, deKubber says.

DeKubber says she believes every event can be transformative, and that a person can benefit from even traumatic events in a positive way. The key, she says, is the emotional component.

“If you have an opportunity for personal growth and will grab at every opportunity through that process, you will be transformed in a positive way,” she says.

Keeghan’s accident pushed him to try not to worry about things so much, and instead has made him more happy-go-lucky.

“I’ve learned to never take things for granted,” he says. “I know it sounds cliché, but you never know when your time’s gonna be up.”

**HOW TO HELP A FRIEND THROUGH RECOVERY**

**+LISTEN**

Participate in the grieving process by listening, in order to understand without trying to form an opinion.

**+LET THEM CRY, YELL OR CURSE**

Allowing people to express anger, frustration and pain will help them fully recover emotionally.

**+PROVIDE A SAFE ENVIRONMENT**

Somewhere they can express themselves and feel comfortable.
When Western junior Moses Garang was first separated from his mother, it was 1989 and he was only 7 years old. Startled in his sleep by gunshots in the darkness, he was swept into a stampede of frantic citizens fleeing the tiny city of Pachella, Sudan. By sunrise, the troop had swelled to nearly 20,000 displaced people. More than half were like Garang—young, orphaned boys who, dislodged from their families and unwelcome in their homeland, would come to be known as the “Lost Boys of Sudan.”

Garang says he and the first Lost Boys who arrived had to build the huts and dig the wells that would sustain them for an indefinite number of years. The boys began to attend school, and in some cases, start families. Despite hardships, it appeared they were creating a new beginning for themselves.

“But for 95 percent of the 12 million refugees worldwide, hope for a new life arrives in the form of the U.S. Embassy. While this may seem like a small proportion, the U.S. accepts more than double the number of refugees than the other nine countries that carry out resettlement programs combined, according to the Office of Refugee Resettlement. Garang remembers his plane ride to the U.S.: brimming with fidgety boys, who grinned anxiously at the thousands of other refugees who lined the dusty airstrip to wave goodbye.

For many individuals fleeing their homeland, refugee camps mark the end of one harsh journey and the beginning of another—relocation into a new life. But, Kakuma was not intended to be a permanent residence for the boys. By definition, a refugee camp is considered a temporary place of sanctuary for those fleeing their homeland. The next step is for camps to foster permanent resettlement of refugees into the countries they have fled to, says Sandra Van Der Pol, the refugee project coordinator for World Relief in Seattle. However, she says this is frequently not possible, as many refugees are often unwelcome in even their shelter countries.
Each day after that first departure, the remaining Lost Boys bused to the Kakuma camp posting board, waiting for their names to appear on the mysteriously calculated U.S. Embassy departure list. The list, Garang says, became a source of hope for the Lost Boys. “The United Nations were taking care of us. They were like our family,” he says. “And I had this in my mind that the U.S. government would take care of me too and provide me with resources and get opportunities to go to college.”

Garang says his hardest and most surprising struggle was grocery shopping. On the plane, after fleeing Sudanese Community of Washington, says that the biggest concerns for refugees are stories laden with success. “Growing up (in Ethiopia), you don’t have a dream of what you want to be,” Said says. “But up here, they ask you in kindergarten what do you want to be.”

The chance to come to the U.S. as a refugee or immigrant offers a new start on life that would be impossible otherwise, Garang says. It also offers individuals searching for an identity, such as the Lost Boys of Sudan, the chance to become a part of and have an effect on the community.

Garang has found his place in America. Stepping foot back in his mother country after nearly a decade apart, Now 25, Garang is a Western senior majoring in business management. He became a U.S. citizen in 2007 and has since returned to Africa and reunited with his mother and father after nearly a decade apart. For some refugees and immigrants, the new start is overwhelming. They may find themselves victims of their own cultural misunderstandings. “Most come from the countryside,” Said says. “They have never seen a city. They have never seen freedom. So when they come here, it’s the end of the world. They have too much freedom. Sometimes they just go the wrong direction.”

The new freedom can often lead to legal issues. Anne Wennerstrom is program manager of the Newcomers Resource Project at the King County Bar Association. “The Newcomers Resource Project provides volunteer attorneys for low-income immigrants, refugees and newcomers to King County.”

Merri Anne Osbome, a family support manager for the Southern Sudanese Community of Washington, says that the biggest concerns for refugees are stories laden with success. “Growing up (in Ethiopia), you don’t have a dream of what you want to be,” Said says. “But up here, they ask you in kindergarten what do you want to be.”

12 percent of the state population is foreign-born,” she says. “So really, if you look at the whole picture, you can’t escape the fact that they are a critical part of our society. If you look at our history, when we’re able to effectively integrate immigrants in, it’s good for us. Our economy grows, our culture grows.”

Now 25, Garang is a Western senior majoring in business management. He became a U.S. citizen in 2007 and has since returned to Africa and reunited with his mother and father after nearly a decade apart. Stepping foot back in his mother country in October 2008, he felt a deep connection with his people and plans to return to help rebuild Southern Sudan with the opportunities he has gained from his new life. No longer a Lost Boy, Garang has found his place in America.

Pramila Jayapal is executive director of OneAmerica, the largest non-profit immigrant advocacy organization in Washington. She believes that part of the root cause of discrimination and oppression of foreign-born residents is a miscalculation of their value and contribution to the community. “Twelve percent of the state population is foreign-born,” she says. “So really, if you look at the whole picture, you can’t escape the fact that they are a critical part of our society. If you look at our history, when we’re able to effectively integrate immigrants in, it’s good for us. Our economy grows, our culture grows.”

TRANSFORMATION

writer ZACK HALE
photographer KATHRYN BACHEN

On a sunny afternoon outside of Houston, Texas, Danielle Watts stands on a 30-foot railroad bridge running over a rocky creek behind her mother’s house, staring down an oncoming train.

The wooden planks and steel tracks of the trestle begin to tremble beneath her feet as the locomotive speeds toward her—it’s horn piercing the air in a throaty warning. Get out of the way, it urges her. She refuses.

Instead, Watts remains, gazing at an imminent death. Tired of being called a ‘fag’ by what she describes as her conservative, gun-toting, archetypical Texan family, and mired in sorrow because she was born male, instead of female, Watts has lost the desire to live, as many pre-transition transgendered individuals do. So

or more, with male-to-female (MTF) transgendered individuals being more likely to attempt suicide than female-to-males (FTM), according to the King County Office of Public Health and Safety. Although research is scant, many agree the transgendered community is plagued by instances of suicide because the path toward assuming a woman’s body, when one was originally born a man, or vice versa is littered with obstacles. Some challenges are small and easier to surmount, like acquiring a new wardrobe or becoming accustomed to using the opposite gender’s restroom. Others are bigger, such as successfully dealing with the emotions associated with coming out to one’s self, family and employer; obtaining a new driver’s license and birth certificate; and undergoing rigorous hormone therapy that has dramatic physiological effects.

Living as a full-time MTF, Watts knows these hardships well, having endured what at times seemed to be an endless set of barriers that stood in the way of becoming her true self.

Family

A 7-by-4 foot table sits in the middle of Watts’ grandmother’s living room—the kind of table you would expect the Cartwrights to sit down at, she says. A 16-year-old Watts sits at the head of the table while several of her uncles, who live outside of town, occupy the other seats. Her mother and grandparents stand off to the side in the living room, looking on.

The mood is tense as Watts’ uncles proceed to spend two hours admonishing her—telling her how if she continues to be a fag, she will be struck by a train—out of the way. “I didn’t go because that person never really existed in the first place,” she says.

As the time, it wasn’t ‘my family betrayed me’, it was, ‘I betrayed my family,’” Watts says. “That’s the mindset I had.”

At the end of a six-year bout with depression, Watts, now 28, realized she was not the problem. After graduating from high school, she began to live what is referred as a “16-7,” which means she immersed herself in school and work for 16 hours a day, seven days a week. She now holds four different degrees, including an associate degree in computer programming and master’s in creative writing. In 2006, Watts moved to Seattle and landed a job with Microsoft, where she worked directly under founder Bill Gates and CEO Steve Ballmer. Most family members would be incredibly proud of such accomplishments, but the majority of Watts’ were not.

Her youngest brother was recently married and told her she could not attend the wedding unless she came as who she was “before [she] started all this weird fag shit,” she says.

“I didn’t go because that person never really existed in the first place,” she says.

Not all transgender individuals’ familial relationships are so strained. Cory Hoffman, who identifies as transgender and is the coordinator of Women’s transgender support group, TransFor, says he had his parents’ support early on. Both of Hoffman’s parents, who are gay, sent him to a Lesbian, Gay, Bisexual and Transgender Alliance camp when he was young, where he quickly realized that the female body he was born into felt wrong.

“I didn’t really wrestle with it,” Hoffman says. Hoffman quickly entered counseling with a therapist specializing in gender-identity issues, and with his parent’s consent, began to take testosterone in high school. He also recently had chest surgery to remove breast tissue, casting aside the last vestiges of his previous gender.

Today, he is a young man with a voice as deep as any other and sports a thick, black chinstrap beard that fuses his jaw.

One of the hardest things to do while transitioning to the opposite gender is to stay employed. Those who can make the transition without losing their house, family and job are considered success stories, Yadle says.
Washington state’s transgender community is plagued by chronic unemployment, says Rory Gould, a full-time FTM transgendered person and president of the Washington Gender Alliance. Most transsexuals are unable to survive in their current place of employment once they come out, especially if their job requires contact with the public, he says.

“Dealing with the public speaks employees because they think [transgendered persons] will hurt business,” Gould says.

Transgendering is often harder on MTFs working in ‘macho’ industries—such as construction, truck driving and auto repair—where the work force is typically male-dominated and prone to harboring prejudices, Gould says. But, the same can be said for women who assume male bodies in female-dominated industries such as food service at certain restaurants.

Finding work after leaving an old job can be equally challenging when one’s credentials, work history and other pertinent information are all under an old name, Gould says.

“When you’re newly transitioned you have no life history,” he says.

Many transgendered individuals are then faced with a choice.

“Do you lie about your past, or tell the truth?” Gould says.

“They do and survival depends on the outcome of these types of decisions.”

Unfortunately, accurate statistics regarding transgendered employment are nearly impossible to come by, Gould says.

“Any statistic you see is a guess, because there are vast numbers of transgendered persons who are unwilling to publicly raise their hand and say, ‘I’m one’,” Gould says. “They’re afraid of the exposure.”

Watts echoes this sentiment, citing Texas’ intolerance as one of the reasons why she left her life behind in exchange for a new beginning in a more open-minded city.

“One of the great things about Seattle is I can be wearing beach shorts and a tank top, walk into 99 percent of the restaurants there, have money, eat, pay and walk out no problem,” Watts says. “In Texas, if I tried to do that they wouldn’t even let me through the door.”

Hormones and surgery

Watts says the biggest obstacles transgendered individuals face generally revolve around interacting with other people, whether it be a family member or employer. But, the physiological challenge of crossing the gender divide should not be discounted either. Transitioning can be a highly expensive and emotionally disconcerting. Hormone regimens are guaranteed to alter a recipient’s biological makeup, and the average cost of MTF sex reassignment surgery is about $20,000, according to a recent study conducted by Mary Anne Horton, a professor at Berkeley. The average price tag of FTM sex reassignment surgery, which is a less complex procedure, is about $12,900.

Without insurance, transgendered individuals must pay out of pocket. This requires many to save for several years, and those working low paying jobs often have little hope of ever having sex reassignment surgery performed.

While hormones are far less expensive than surgery, they still have dramatic effects. Hoffman says he experienced “roid rage,” where he would get angry more frequently, and his sex drive went through the roof.

“I thought I had a high sex drive before I started taking testosterone, but it was nothing compared with afterward,” he says.

Most surprising was how quickly his voice dropped, he says, which literally occurred over a two-day period.

Unlike Hoffman, Watts had to train herself to speak in a higher tone. But unlike many MTFs, Watts says she feels lucky because she has a naturally feminine figure. Physical characteristics matter little to Watts though—she values self-confidence above all, and believes it to be the most telling characteristic a transgendered person can have.

“I’ve seen stunning, beautiful trans girls who just have no self confidence,” she says.

“Even though they put so much work into it, they don’t carry a little bit of that ‘I’m a woman and I’m proud of it’ demeanor with them—and you can tell right off the bat.”

One must identity as the man or woman they wish to become, or else he or she will remain stuck with only one foot in the door, she says.

Awakening

At the bottom of the creek bed, Watts wakes up. It has been several hours since the train came and went. She remembers the trestle dawdling under the train's weight, the sound of its horn and fleeting images of slowly falling off the bridge. She thinks she might have fainted, but is unsure. Excluding minor bruises and abrasions, she marvels at the fact that she has escaped serious injury.

She slowly gathers herself, stands up, and begins to walk back home. Her family will not notice her when she returns. And no one will protest when she leaves a few days later for college, seldom to be heard from again. But at this moment, there is something different about Danielle Watts. She knows she has to get better. Her path forward has been illuminated.

Today, Watts is a confident woman.

On April 4, 2010, Watts will finally have sex reassignment surgery, taking the final step in becoming the woman she already is.

Danielle Watts, who was born a male, transitioned to being a woman three years ago when she moved to Seattle. Originally from Texas, Watts says she waited until she moved to the Northwest to fully transition because she felt it would be more widely accepted. Of her friends from college, only one wore their hair long after the transition. “I’m blessed in my life with both a good family and several friends,” Watts says.
