Life stages and survival of steelhead

Embryo/alevin

Juveniles

Freshwater

Smolts

Marine

Adults
Size-selective mortality

Juvenile population size-at-annuli distribution

Survived to Smolt stage
Survived to Adult stage
Questions:

- Are faster-growing juveniles more likely to survive to later stages?

- Does size matter more in certain habitats?
Steelhead were sampled as:

- **Juveniles (2011-2012; age 0-3)**
- **Smolts (2012; age 1-5)**
- **Adults (2008-2012; various ages)**

[Map of river systems with sampling sites indicated]
Data collection

Juveniles

Fork length (mm)

Smolts

Fork length (mm)

Adults
Back-calculate size-at-annuli

\[ FL = 176.7 \times (SR) + 12.0 \]

\[ r^2 = 0.93 \]
Occurrence of size-selective mortality: 2-way ANOVA

Annulus-1:
Snow > Mixed (no interaction)
Juveniles < Smolts & Adults
= Freshwater SSM

Annulus-2:
Juveniles < Smolts < Adults
= Freshwater & Marine SSM

Annulus-3:
Juveniles & Smolts < Adults
= Freshwater & Marine SSM
Magnitude of size-selective mortality: K-S 2 Sample Test

Annulus-1:
Juveniles ≠ Smolts & Adults
Low-to-moderate Freshwater SSM

Annulus-2:
Juveniles ≠ Smolts ≠ Adults
High Freshwater & Marine SSM

Annulus-3:
Juveniles ≠ Smolts ≠ Adults
High Freshwater & Marine SSM
Conclusions

1) Size at annuli-2 and -3 strongly influences survival

1) Growth in natal habitats important, but we need more detailed evaluation of habitat effects on growth and survival

1) **Usefulness:** If SSM is significant, evaluating and improving growth in freshwater habitats could be useful tool for recovery

Measure of size-selective mortality: K-S 2 Sample Test

**Annulus-1:**
Juveniles ≠ Smolts & Adults

**Annulus-2:**
Juveniles ≠ Smolts ≠ Adults

**Annulus-3:**
Juveniles ≠ Smolts ≠ Adults
Larger smolt = Greater marine survival

Between final annulus and smolting...

Smolt sample grew 22% in FL

Adult sample ONLY grew 16% in FL

Smolt sample grew 11% in FL

Adult sample ONLY grew 9% in FL
