This Event is brought to you for free and open access by the Conferences and Events at Western CEDAR. It has been accepted for inclusion in Salish Sea Ecosystem Conference by an authorized administrator of Western CEDAR. For more information, please contact westerncedar@wwu.edu.
Conserving forage fish beach spawning habitats in British Columbia

Salish Sea Ecosystem Conference Session 2.2
Presentation SSE1-104

Rachel Wang, WWF-Canada
Haley Tomlin, Mount Arrowsmith Biosphere Region Research Institute
Outline

• State of beach protection
• State of beach monitoring
• Technical document for beach surveys
  – Predictive tool
  – Methods
  – Pilot sites
• Next steps
State of beach protection in British Columbia

- Limited Best Management Practices
- No existing policies that specifically identify forage fish beach spawning habitat protection, **BUT** recent attention from Fisheries and Oceans Canada (DFO):

November 2016
Launched Coastal Restoration Fund

March 2018
Hosted “Filling the Forage Fish” Gap Science Workshop

February 2018
Introduced Bill C-68
State of beach monitoring in British Columbia

• **2008**: BC Shore Spawners Alliance began conducting beach surveys throughout Strait of Georgia
• **2013-2018**: Islands Trust Fund suitable habitat assessments for Gulf Islands
• Presently lacking data on spawning habitats; poor database management
• Similar to Moulton & Pentilla (2001) Field Manual
  – Site selection (predictive modelling)
  – Beach survey (WDFW vortex method)
  – Quality Assurance Quality Control
    • Lab analysis
    • Data reporting
• Adapting Washington Department of Fish and Wildlife (WDFW) methods and existing methods in British Columbia (BC)
• Finalizing first draft for US and Canada expert input and review
ShoreZone predictive tool

- Coastal and Ocean Resources compared 2 datasets to develop ShoreZone predictive tool (Harper & Borecky 2003)
- Used potential habitat attributes and applied to BC ShoreZone database

British Columbia ShoreZone predictive tool
Mount Arrowsmith Biosphere Region Research Institute (MABRRI)
Predictive Mapping

Nanaimo Area
Predicted
Forage Fish Habitat

The predicted forage fish habitat identified using the "Suitable Forage Fish Spawning Habitat in the Gulf Islands" ShoreZone model is selecting for favourable spawning habitat attributes for forage fish, including specific sediment types, presence of overhanging vegetation, and protected to semi-exposed beach types.

Scale 1:75,000

Imagery sourced from Esri
Predicted habitat model created by Coastal & Ocean Resources Inc.
Suitable forage fish habitat sourced from Islands Trust
Beach Surveying
MABRRI’s Sample Sites

- To start, focused on the Parksville Qualicum Beach area
- Established sites that we will monitor frequently in the upcoming summer and winter spawning seasons
Next steps

• Resume conducting beach surveys along the Vancouver Island and Gulf Island coastlines, beginning in May
• Finalize Technical Document for BC beach surveys
• Work towards developing and implementing an updated training program that can be used throughout the BC Salish Sea
Thank you!
