Contaminant Profiles in Priority Chinook Salmon Stocks Consumed by Resident Killer Whales in the Northeastern Pacific Ocean

Fisheries and Oceans Canada Pêches et Océans

Introduction

Southern Resident Killer Whales (Orcinus orca) SRKW

- 74 individuals (3 pods: J, K, and L) inhabiting transboundary waters of the Salish Sea down to southern California, US¹
- Listed as *Endangered* in Canada (2003) & United States (2005)
- Top three current threats²
 - Availability or quality of priority prey, Chinook salmon
 - 2. Environmental contaminants

Canada

- 3. Physical and acoustical disturbance
- Northern Resident Killer Whale (NRKW) sympatric population with similar diet but annual population growth³
- Diet studies revealed most consumed Chinook stocks for SRKW and NRKW come from the following river systems ^{4,5,6}:
- Fraser River, Columbia River, Puget Sound, Skeena, and Vancouver Island

Chinook salmon (*Oncorhynchus tshawytscha*)

- Consumed by SRKW year-round, making up 80% of SRKW diet and close to 100% during the spring and summer^{5,6}
- 94% (15/16) Chinook populations in Fraser River at risk or endangered ⁷
- Little information exists on the concentrations in priority contaminants of concern (COCs) in Canadian Chinook salmon stocks

Contaminants of Concern (COCs)

- PCBs, PBDEs, OCPs, dioxin/furans, HBCDD, alkylphenols, and chlorinated paraffins have been identified as contaminants of concern to SRKW and their primary prey, Chinook salmon⁸
- SRKW & NRKW exposed to environmental contaminants mainly through their prey
- Recent analyses show PCB & PBDE blubber concentrations in SRKW exceed marine mammal health thresholds 9,10,11
- Measuring contaminants in primary prey, Chinook salmon, allows for a larger sample size to infer contaminant exposure to RKWs & to account for confounding factors such as age, sex, diet, and migration

Objective

• Characterize 317 analytes from 7 contaminant classes and diet (stable isotope: $\delta^{13}C$ and $\delta^{15}N$) in nine priority Chinook salmon stocks consumed by SRKW and NRKW to better understand contaminant exposure in RKWs

Sample Collection & Processing

- Chinook salmon samples were collected during 2018 & 2019 in the Fraser River estuary, southwest coast and east coast of Vancouver Island in partnership with Albion Test Fishery, Pacheedaht First Nation, and the University of British Columbia
- Muscle tissue subsampled from heads for contaminants and stable isotopes ($\delta^{13}C$, $\delta^{15}N$)

Stock Identification and Selection

- Genetic stock identification via single nucleotide polymorphism (SNP) genotyping
- Based on SRKW & NRKW diet studies from DFO and NOAA the following nine priority Chinook stocks were selected for stable isotope and contaminant analyses:
- East Coast Vancouver Island (ECVI), West Coast Vancouver Island (WCVI), Puget Sound, Columbia River, Skeena River, South Thompson River, Upper Fraser, Mid Fraser, and Harrison River (Lower Fraser)

Methods

Chemical Class	<u>Uses</u>	Status in Canada ¹³
	Electrical equipment,	
CBs	hydraulic systems	Banned in 1977
BDEs	Flame retardants	Production banned; importation, use & sale regulated
OCPs	Pesticides	DDT & chlordanes banned in 1985 & 2003 respectively; others varying regulations
oioxin/Furans	Pulp & paper mills	Elimination of use in progress
BCDD	Brominated flame retardant	Banned in 2017
Ps	Emulsifiers in detergents & pesticides	Amount of input into environment regulated
Ps	Plasticizers & flame retardants	Short-chain banned; MC & LC under evaluation

Far North Migrating

FRASER UNIVERSITY ENGAGING THE WORLD

Figure 3. δ^{13} C and δ^{15} N values (mean <u>+</u> SE) for nine priority Chinook stocks consumed by NRKW and SRKW. $\delta^{13}C$ values were lipid corrected based on Larocque et al., 2021.¹²

Discussion and Conclusions

- ECVI and Harrison Chinook stocks are feeding at higher tropic levels and utilizing more coastal food webs than other priority stocks (Fig. 3);
- Seven stocks are feeding at lower trophic levels and are utilizing more open ocean food webs;
- Despite the banning of PCB and DDT 44 and 36 years ago respectively, they are still being found as the dominant contaminants in priority Chinook stocks consumed by SRKW and NRKW;
- This is first study to report on contaminant concentrations for 317 analytes in eight contaminant classes in adult Pacific salmon Chinook stocks;
- PCBs and DDTs likely pose a continued risk to SRKW and NRKW health and may pose a health risk to some resident Chinook stocks;
- These preliminary results will be used in conjunction with fish and marine mammal toxicity thresholds to prioritize/rank COCs for Chinook salmon and resident killer whales;
- Future work will investigate the significance of the varying stable isotope values and their relationship to contaminant concentrations.

Acknowledgements

The authors would like to thank our partners at the University of British Columbia, Albion Test Fishery, DFO, Pacheedaht First Nations, and the anglers who provided samples to the project. We would especially like to thank Helen Jones at Pacheedaht First Nation for partnering with us and coordinating logistics of sample collection. This work was supported by the Government of Canada's Whales Initiative, DFO's Species At Risk Program, Ocean Wise Conservation Association, and Mitacs. We authors gratefully acknowledge Brown Lab (DFO) team members for processing the Chinook salmon heads, SGS AXYS Analytical Ltd. for running the contaminant analyses, and the Fisk Lab for running the stable isotope analyses.
