# Getting from one size fits all to variable width riparian buffers

Salish Sea Conference  
April 28<sup>th</sup> 2022

Kollin Higgins  
King County Department of  
Natural Resources and Parks

# WRIA 7 - Snohomish

## Historical Chinook Abundance

## Today

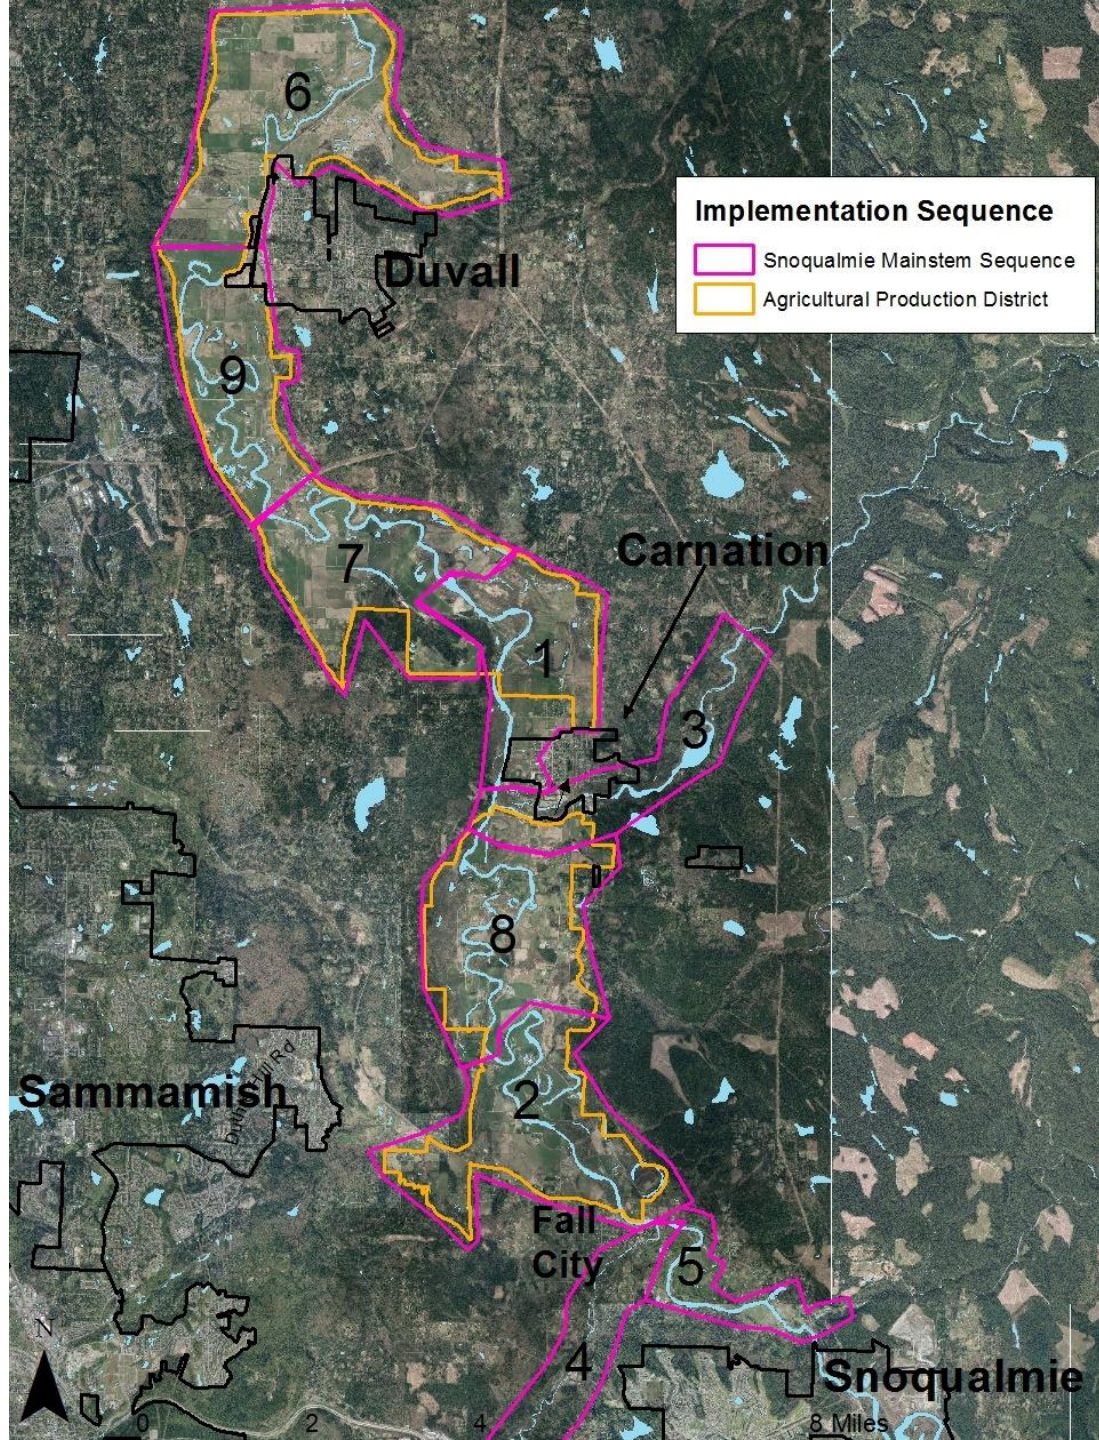

Riparian area  
mostly treeless

Salmon Plan policy  
recommendation: 150ft buffers  
on all salmonid bearing streams

Strong overlap  
between  
agriculture and  
Chinook  
recovery

# 2012 County Council Policy

*“...a collaborative watershed planning process with the goal of maintaining and improving agricultural viability, improving ecological function and habitat quality, and restoring floodplains”*

**What we called  
Fish Farm Flood  
or FFF**

Farm A

Farm B

150 foot  
buffers

# 150 foot riparian buffers would...

- Take ~ 2,600 acres out of agricultural production
- Or about 1/3 of the land currently in agricultural production

## Recommendation: Buffer Task Force in phase 2 of FFF

“To provide the foundation and guidance for a scientifically credible, context-sensitive, locally derived riparian buffer strategy”

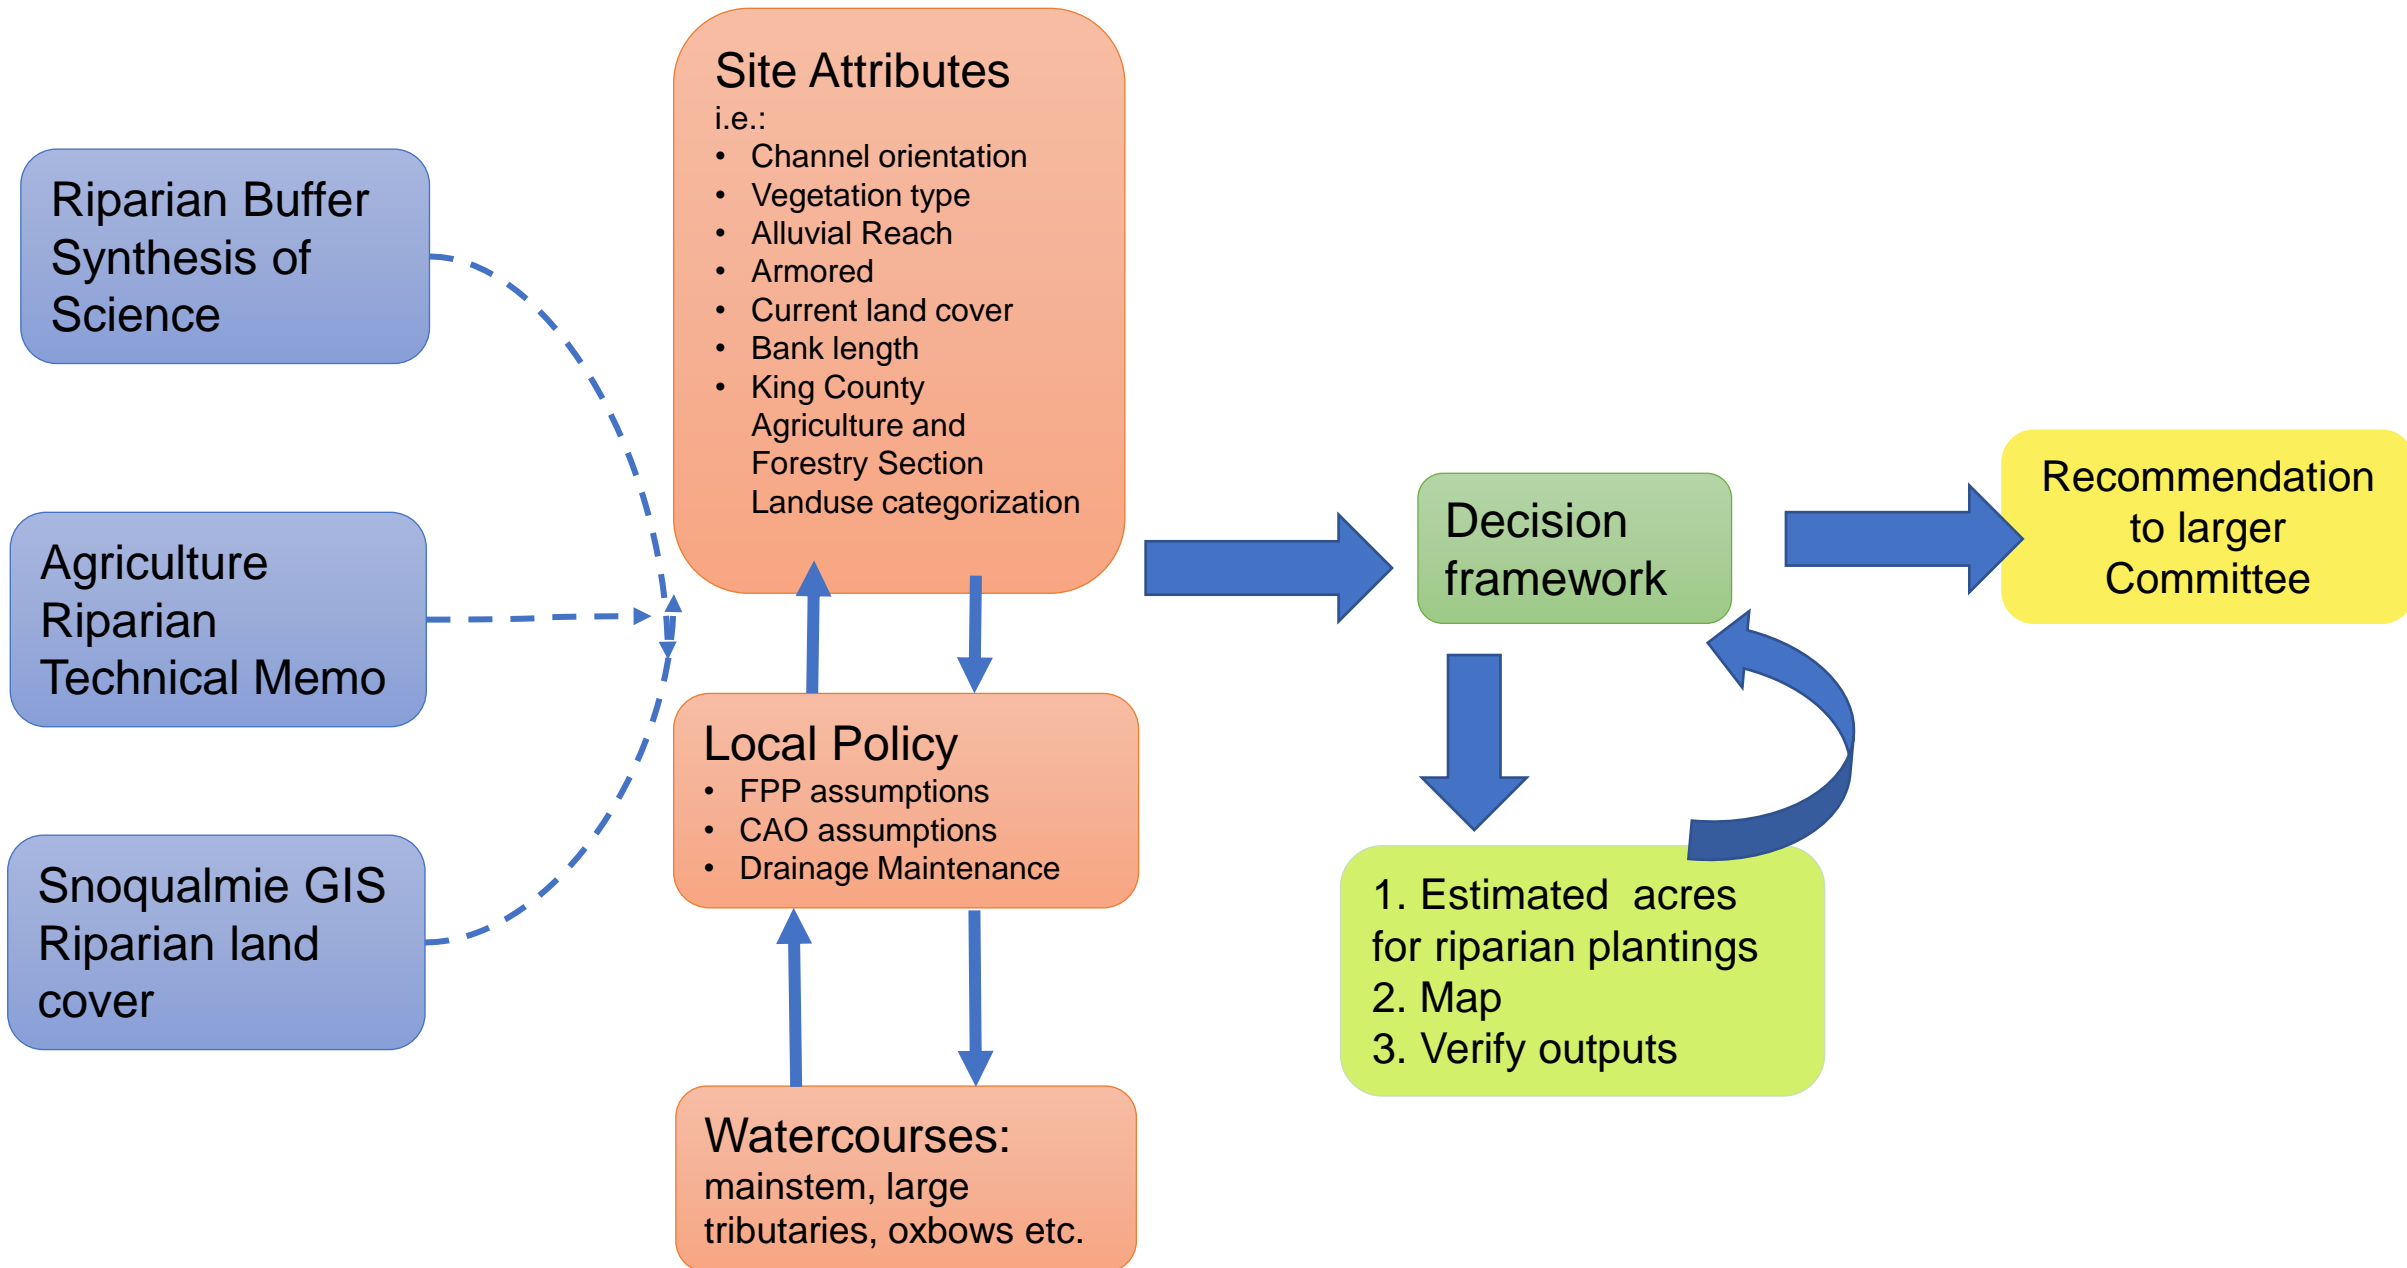

# Buffer Task Force representation

- Tribal representation
- Farmers
- Riparian restoration practitioners
- Property rights groups
- Salmon recovery staff

# Technical Elements for the Buffer Task Force

# Synthesis of Science

- Synthesis of best available riparian buffer science
- Focused on **low gradient floodplain conditions**
- Summarized by function
  1. WQ Nutrients, Sediment, Pesticides
  2. WQ Temperature
  3. Microclimate
  4. Large wood
  5. Erosion
  6. Prey/litter inputs

---

## Synthesis of Riparian Buffer Best Available Science: Informing Variable-Width Buffers in the Lower Snoqualmie Valley

---

# Example—Function: Large Wood

Large watercourses

- Primary wood input = erosion
- Areas of channel migration require wide buffers to provide continual wood sources
- Coniferous trees provide long-term habitat benefits and deciduous provides short-term benefits

Armored watercourses

- Armoring shifts wood input drivers from erosion to wind throw and mortality

Smaller watercourses

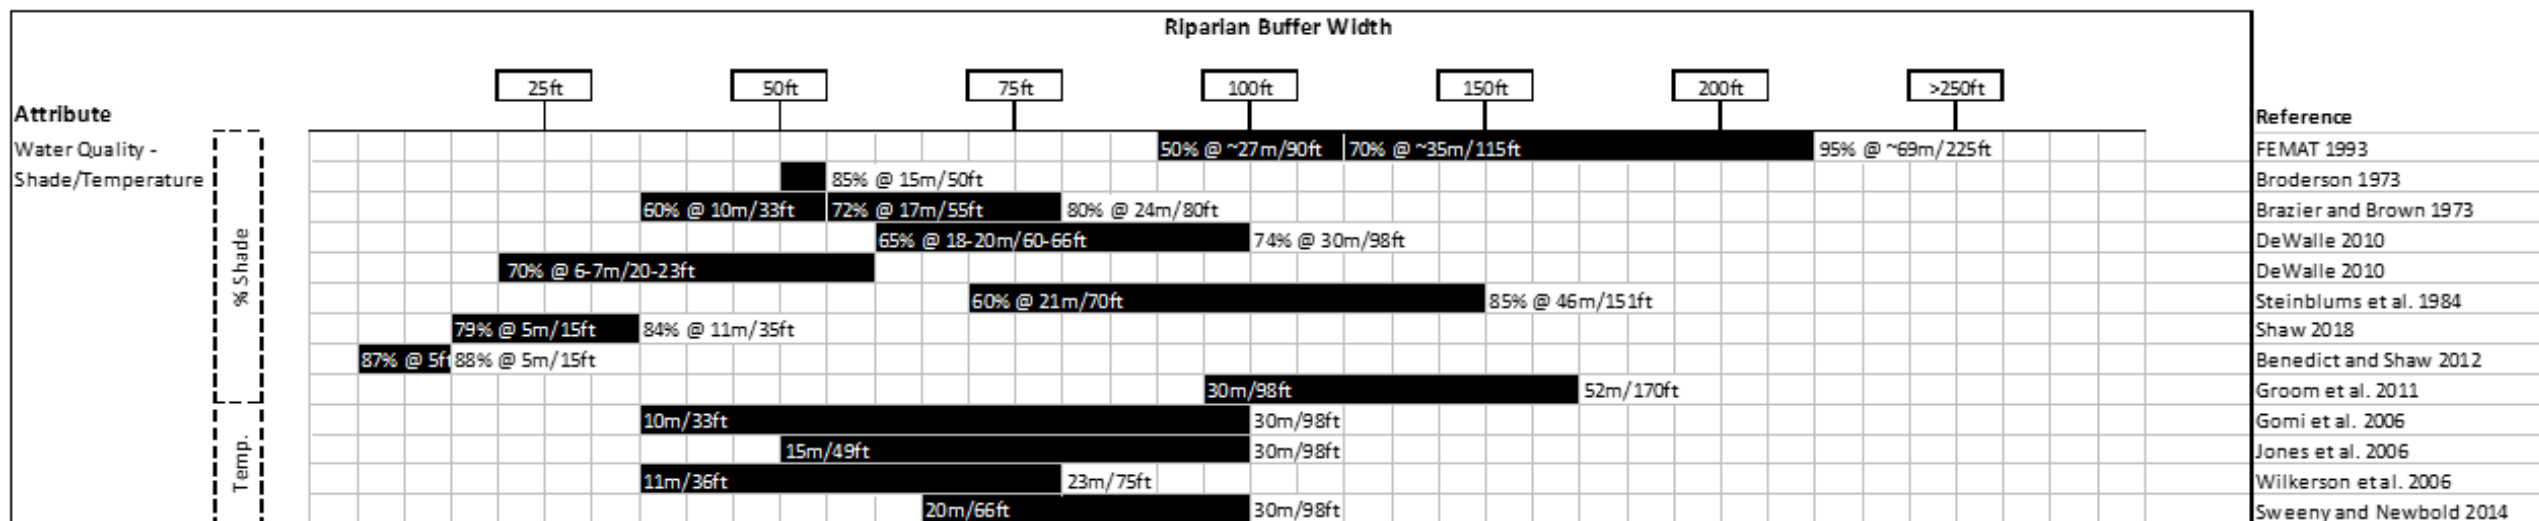

- Size of habitat-forming wood is smaller in smaller watercourses
- Smaller channels receive a greater proportion of woody debris inputs from shorter source distances (closer to watercourses)

High-gradient watercourses

- Primary wood inputs = debris flows, landslides, and wind throw
- High-gradient tributaries contribute to instream wood which is transported to downstream reaches

FEMAT 1993						Reeves et al. 2018	Forest ecosystem management: an ecological, economic, and social assessment
<a href="#">Broderson 1973</a>		Small streams with flows <5 cfs		Western Oregon and Washington	Created an equation from the literature that estimated shade based on riparian width. Found 85% of shade for "small streams" produced from a width of 50 ft.		Sizing Buffer Strips to Maintain Water Quality
Brazier and Brown 1973		"small streams"		Umpqua National Forest; Southern Cascade Mountains; Forestry	80% needed for water temp control and equivalent to full forest conditions; maximum shade at 80 ft and 90% of max at 55 ft	<a href="#">Beschta</a> et al. 1987, <a href="#">Sweeny and Newbold 2014</a> , <a href="#">Osborne and Kovacic 1993</a> ,	Buffer Strips for Stream Temperature Control
<a href="#">DeWalle 2010</a>	Forest	fixed stream width = 3 m (N-S orientation)			Modeled stream shade at different buffer widths, also kept in mind stream orientation. This line is specific to N-S oriented streams, shade was maximized at widths ~30 m		Modeling Stream Shade: Riparian Buffer Height and Density as Important as Buffer Width
<a href="#">DeWalle 2010</a>	Forest	fixed stream width = 3 m (E-W orientation)			Modeled stream shade at different buffer widths, also kept in mind stream orientation. This line is specific to E-W oriented streams, shade was maximized at widths ~7 m		Modeling Stream Shade: Riparian Buffer Height and Density as Important as Buffer Width

Riparian data manually delineated based on recent aeriels

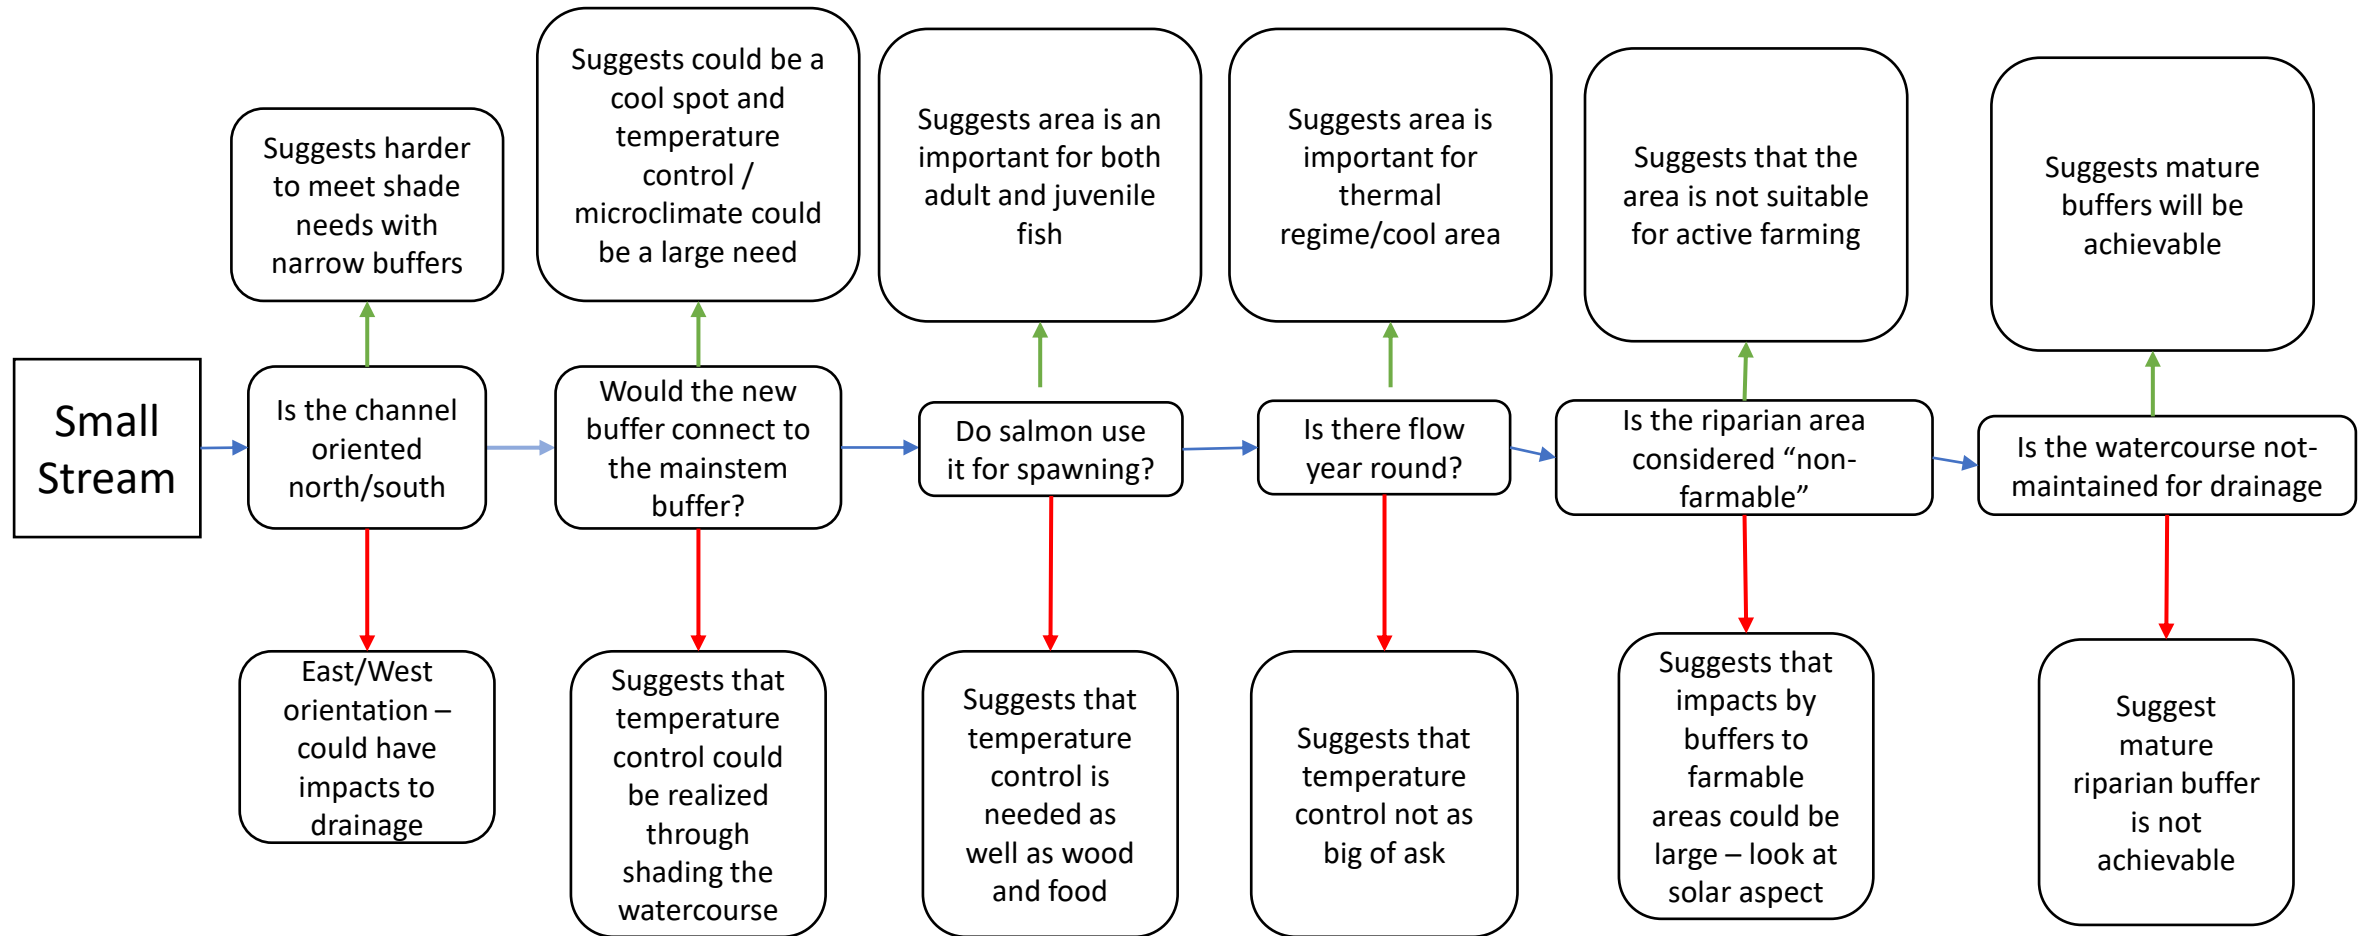

# Stream Classification

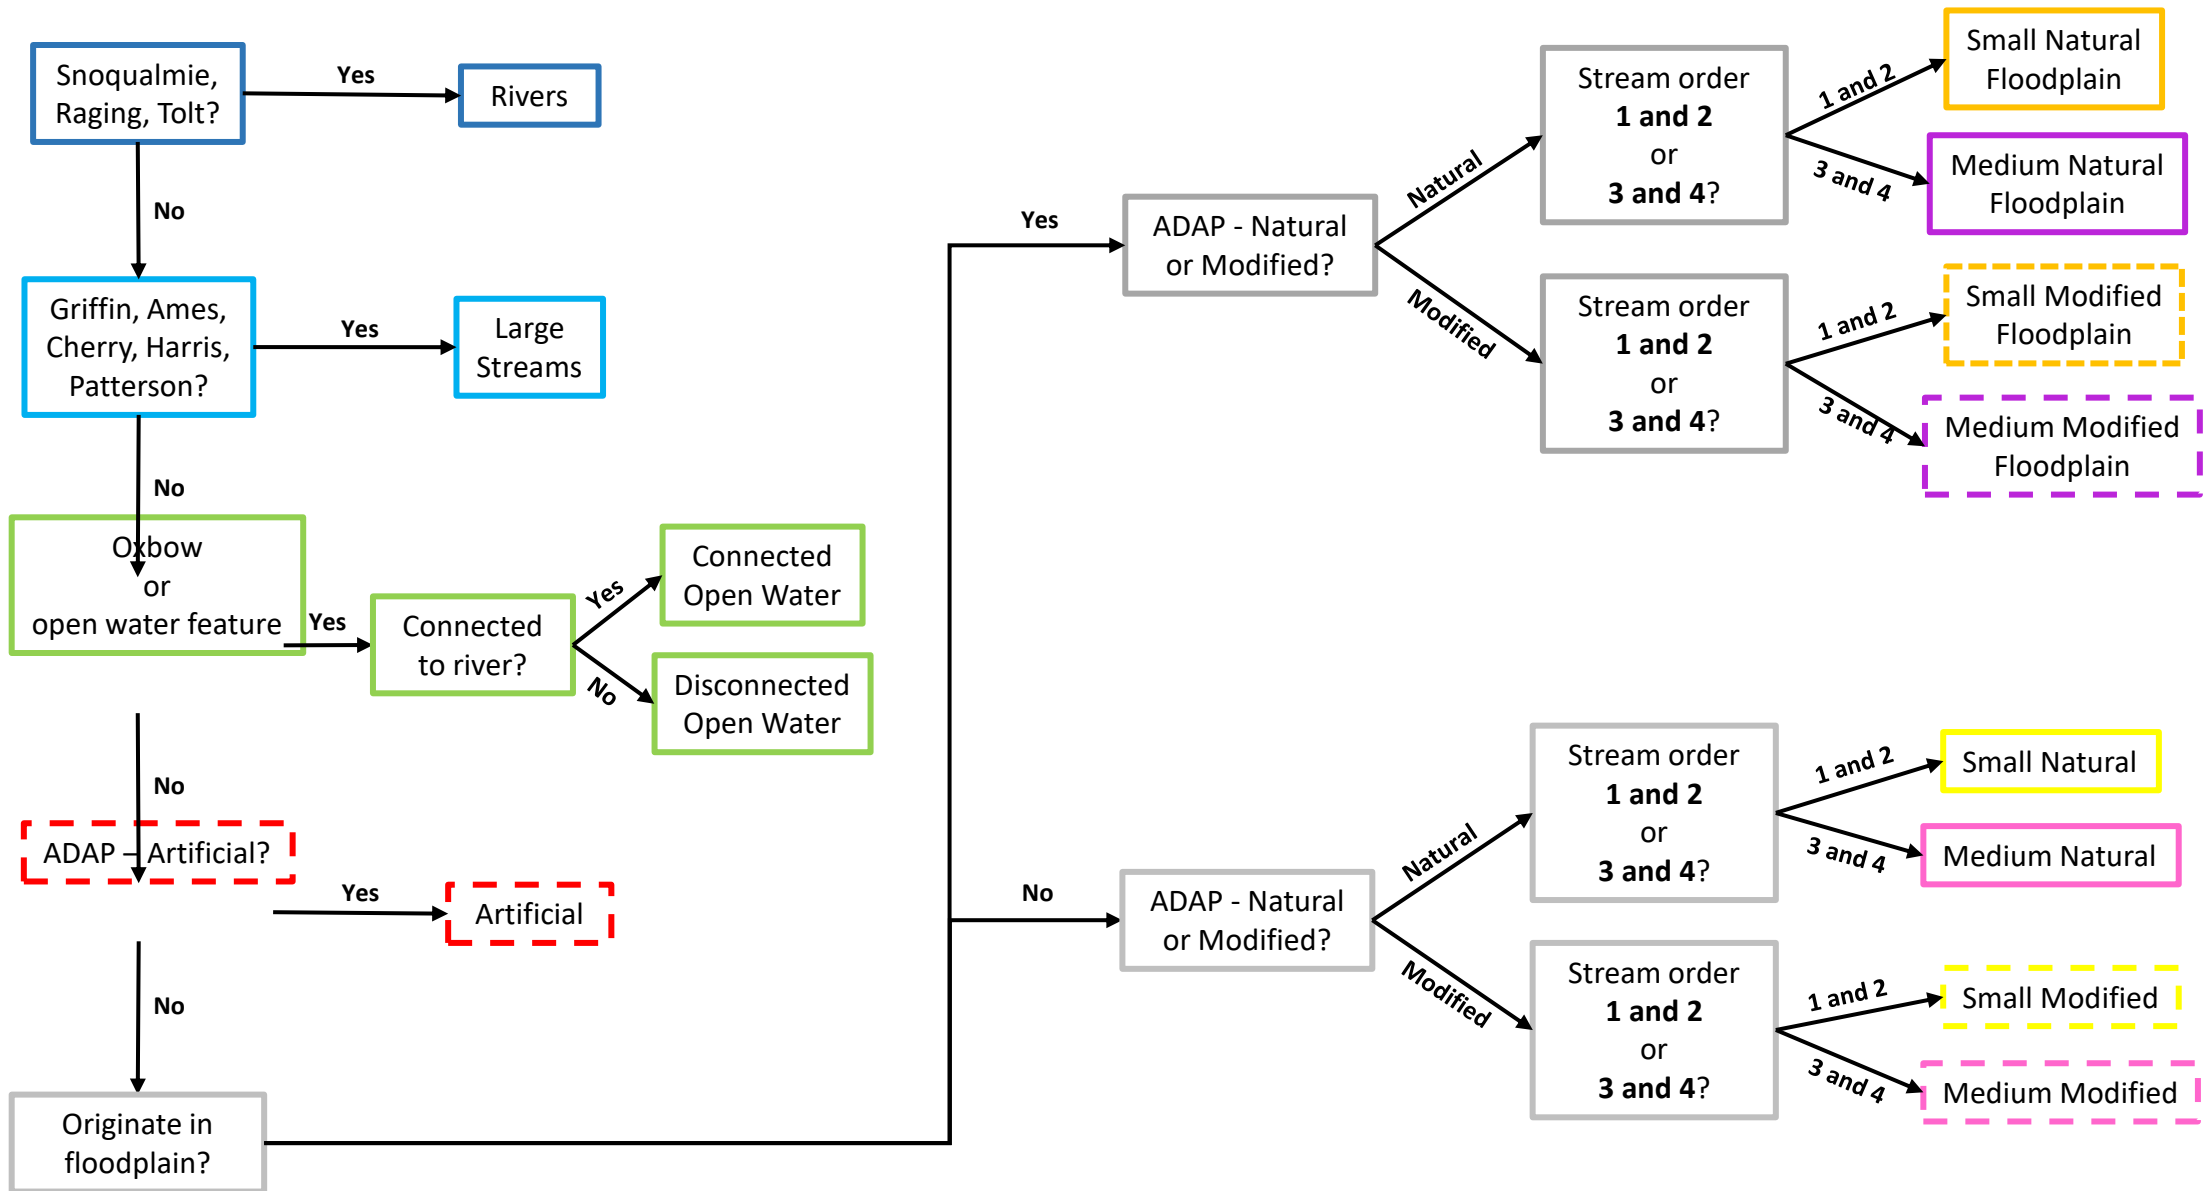

# Example classification

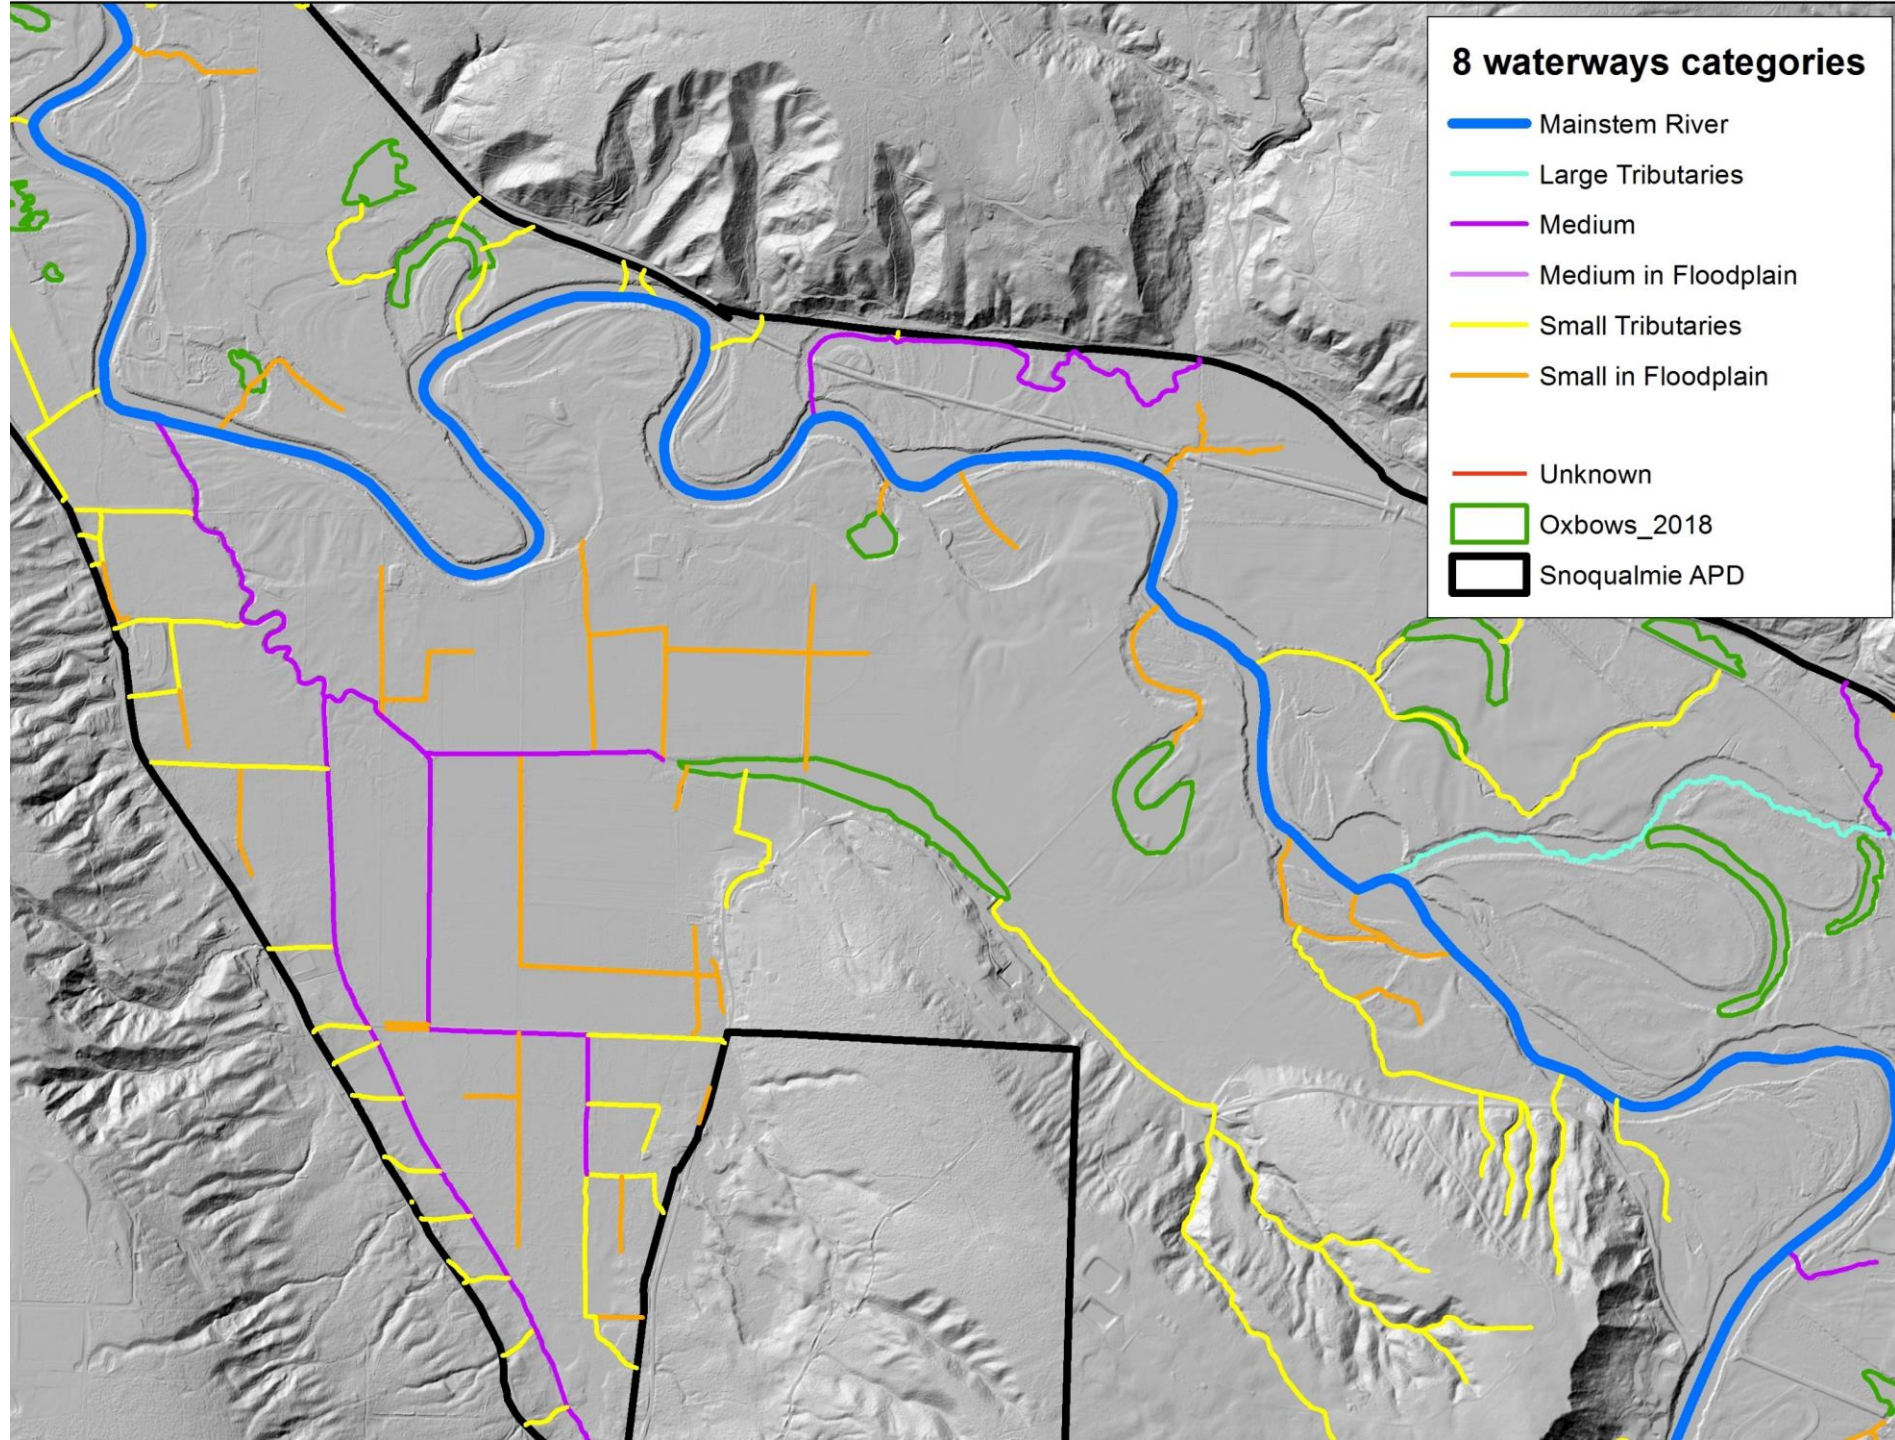

# Example classification

# Streams types?

1. River
2. Large watercourses (basins larger than 8 square miles)
3. Medium watercourses (Strahler's stream order 3 and 4)
4. Small watercourses (Strahler's stream order 1 and 2)
5. Artificial watercourses
6. Oxbow/Ponds

# Additional characteristics?

- Is the channel straightened/modified or sinuous
- Originates outside/inside the floodplain
- Bank armoring
- Solar aspect
- Gravel/spawning reach

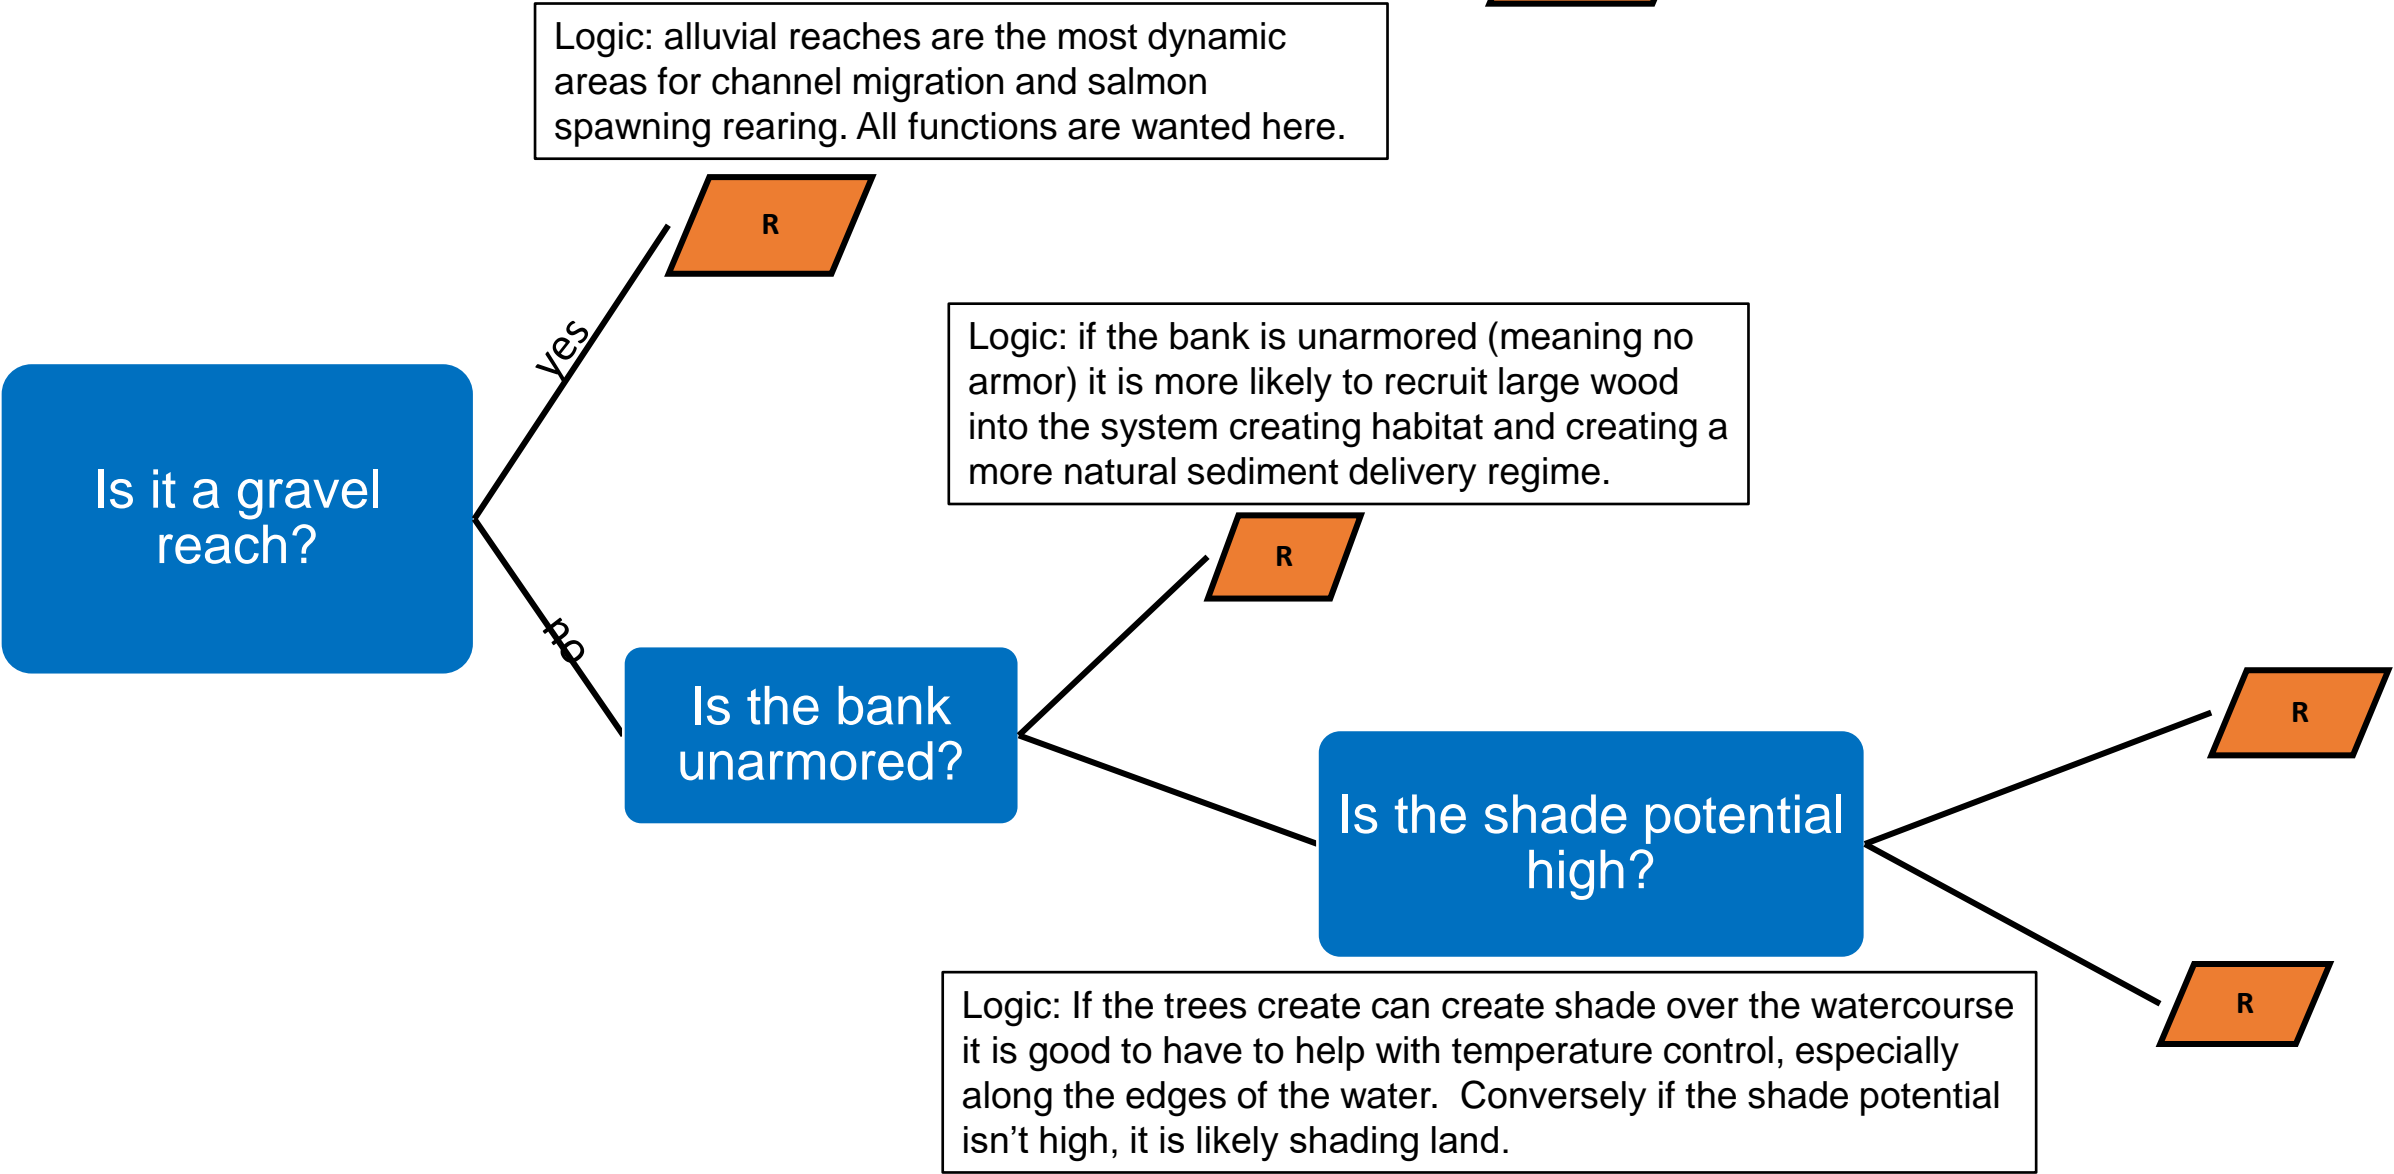

Example of solar aspect

# River Logic Model

 = Recommendation

# River Logic Model

Is it an alluvial reach?

yes

- Existing 150 ft
- Tech Team 200 ft
- Fish Caucus 200 ft
- Farm Caucus 200 ft

yes

- Existing 150 ft
- Tech Team 150 ft
- Fish Caucus 150 ft
- Farm Caucus 150 ft

Is the bank unarmored?

yes

- Existing 150 ft
- Tech Team 100 ft
- Fish Caucus 100 ft
- Farm Caucus 100 ft

Is the shade potential high?

yes

- Existing 150 ft
- Tech Team 50 ft

# Wrap up—Final Agreement

- Is between the County and the agricultural community, but the hope is that all potential parties abide by the agreement
- Voluntary buffers only—these should not be used for mitigation or regulations
- Still pending: a Buffer Implementation Task Force to make revegetation happen faster
