Physiological Health of Glaucous-winged Gulls Wintering in the Salish Sea

Hannah Hall (SFU)

Dr. Tony Williams (SFU)

Dr. Mark Hipfner (ECCC)

Alice Domalik (ECCC)

Dr. David Green (SFU)

Seabirds are useful
“biomonitors”

Gulls are versatile, generalist foragers

Glaucous-winged gulls in the Salish Sea

- GWGU populations have been tracked for > 100 years
- Over 150 years - diet less marine, fewer eggs
- Large population decline since mid-1980s
- Increasingly nesting on urban roofs
- Environment and Climate Change Canada has designated it a priority to study GWGUs

(Blight et al., 2011; 2015; 2019)

Overall project objectives:

1. Understand the movements and habitat use of wintering GWGUs in the Salish Sea using GPS tags.
2. Examine the relationships between GWGU **diet**, **contaminant loads**, **parasitic infections**, and **physiological health** to assess how anthropogenic activity may impact gull health.

Gull health objectives:

- Measure physiological biomarkers:
 - **“Nutritional or Energy state”** = Glucose and free triglycerides
 - **“Aerobic capacity”** = Hematocrit and hemoglobin
 - **“Oxidative stress and damage”** = OXY (total antioxidant titres) and dROMs (reactive oxygen metabolites)
- Determine whether gull health varies by region or habitat type of capture locations.

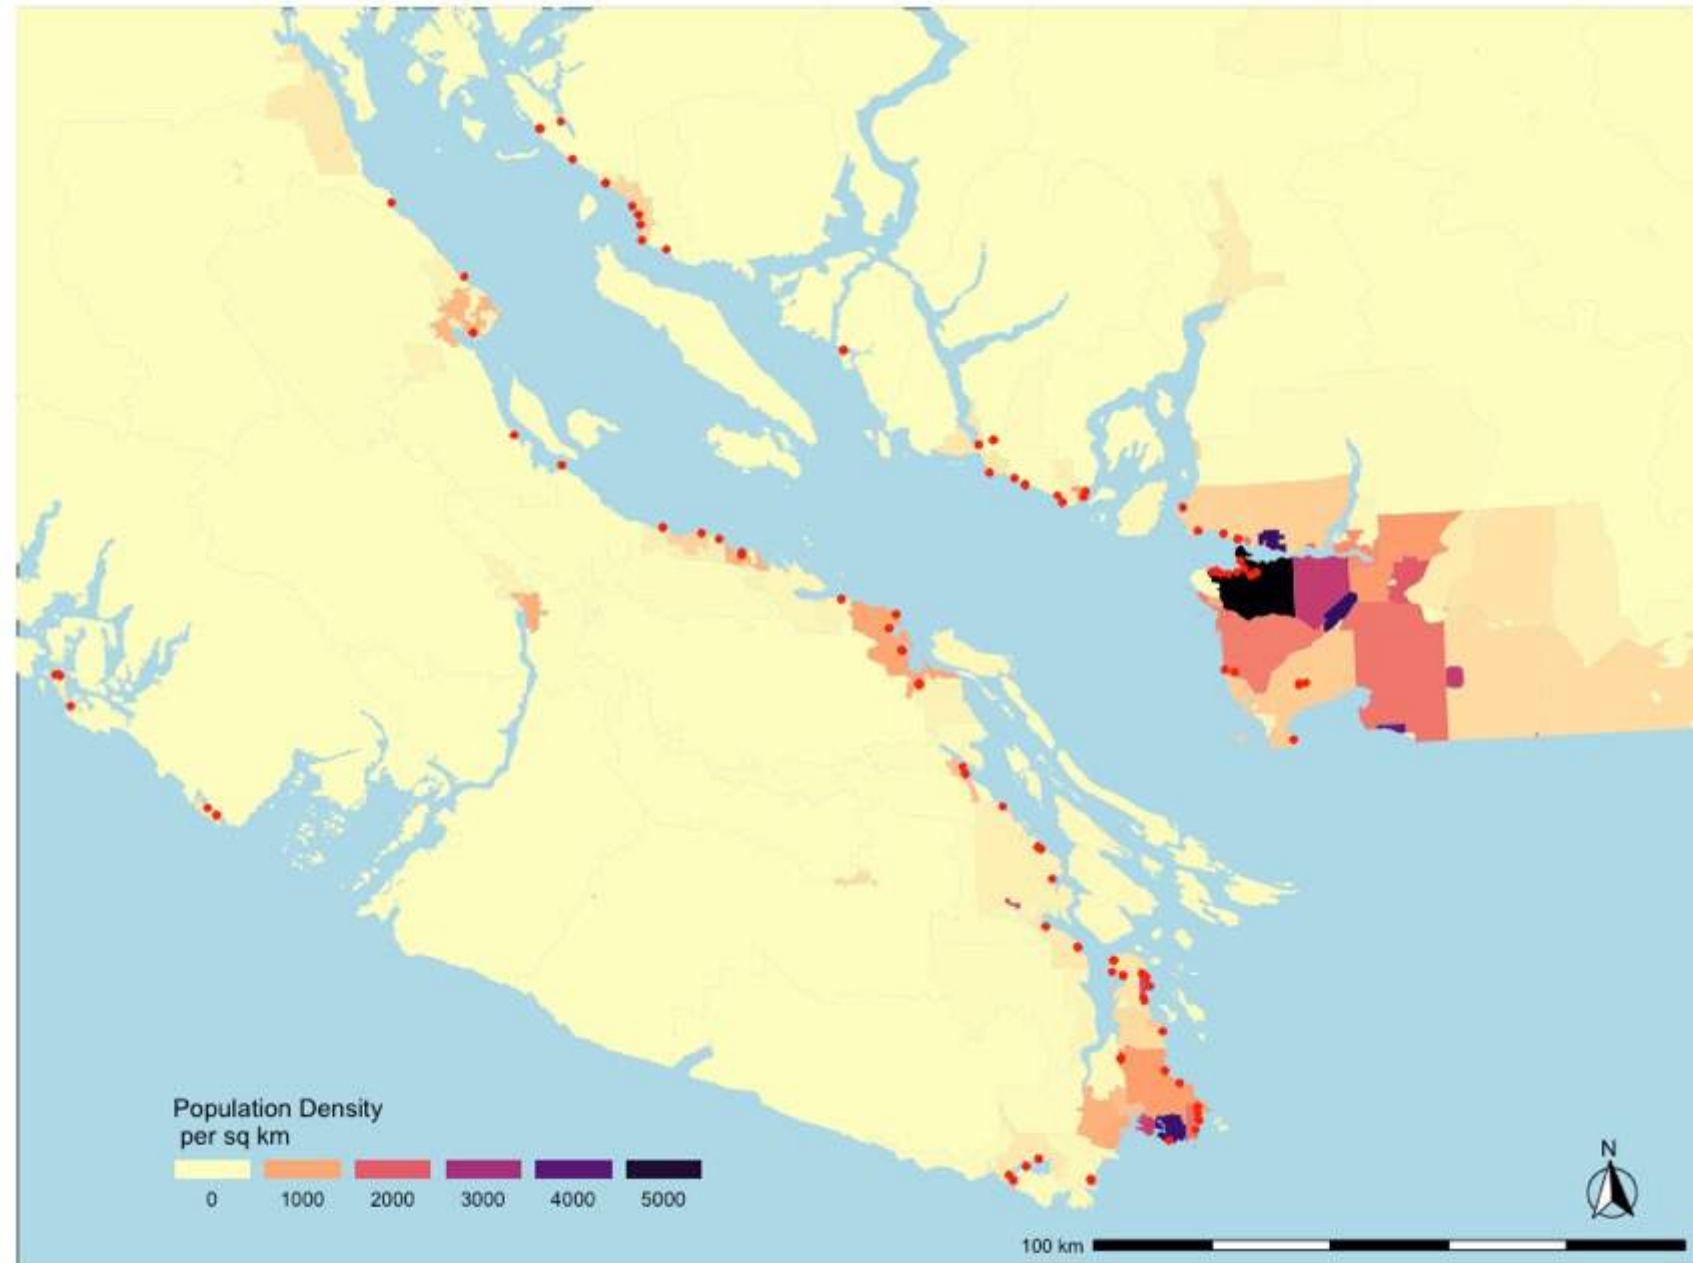

Field methods

- January – February 2020 and 2021
- Capture with bait and noose mats
- Measure and band
- Collect a few feathers & a small blood sample
- Release

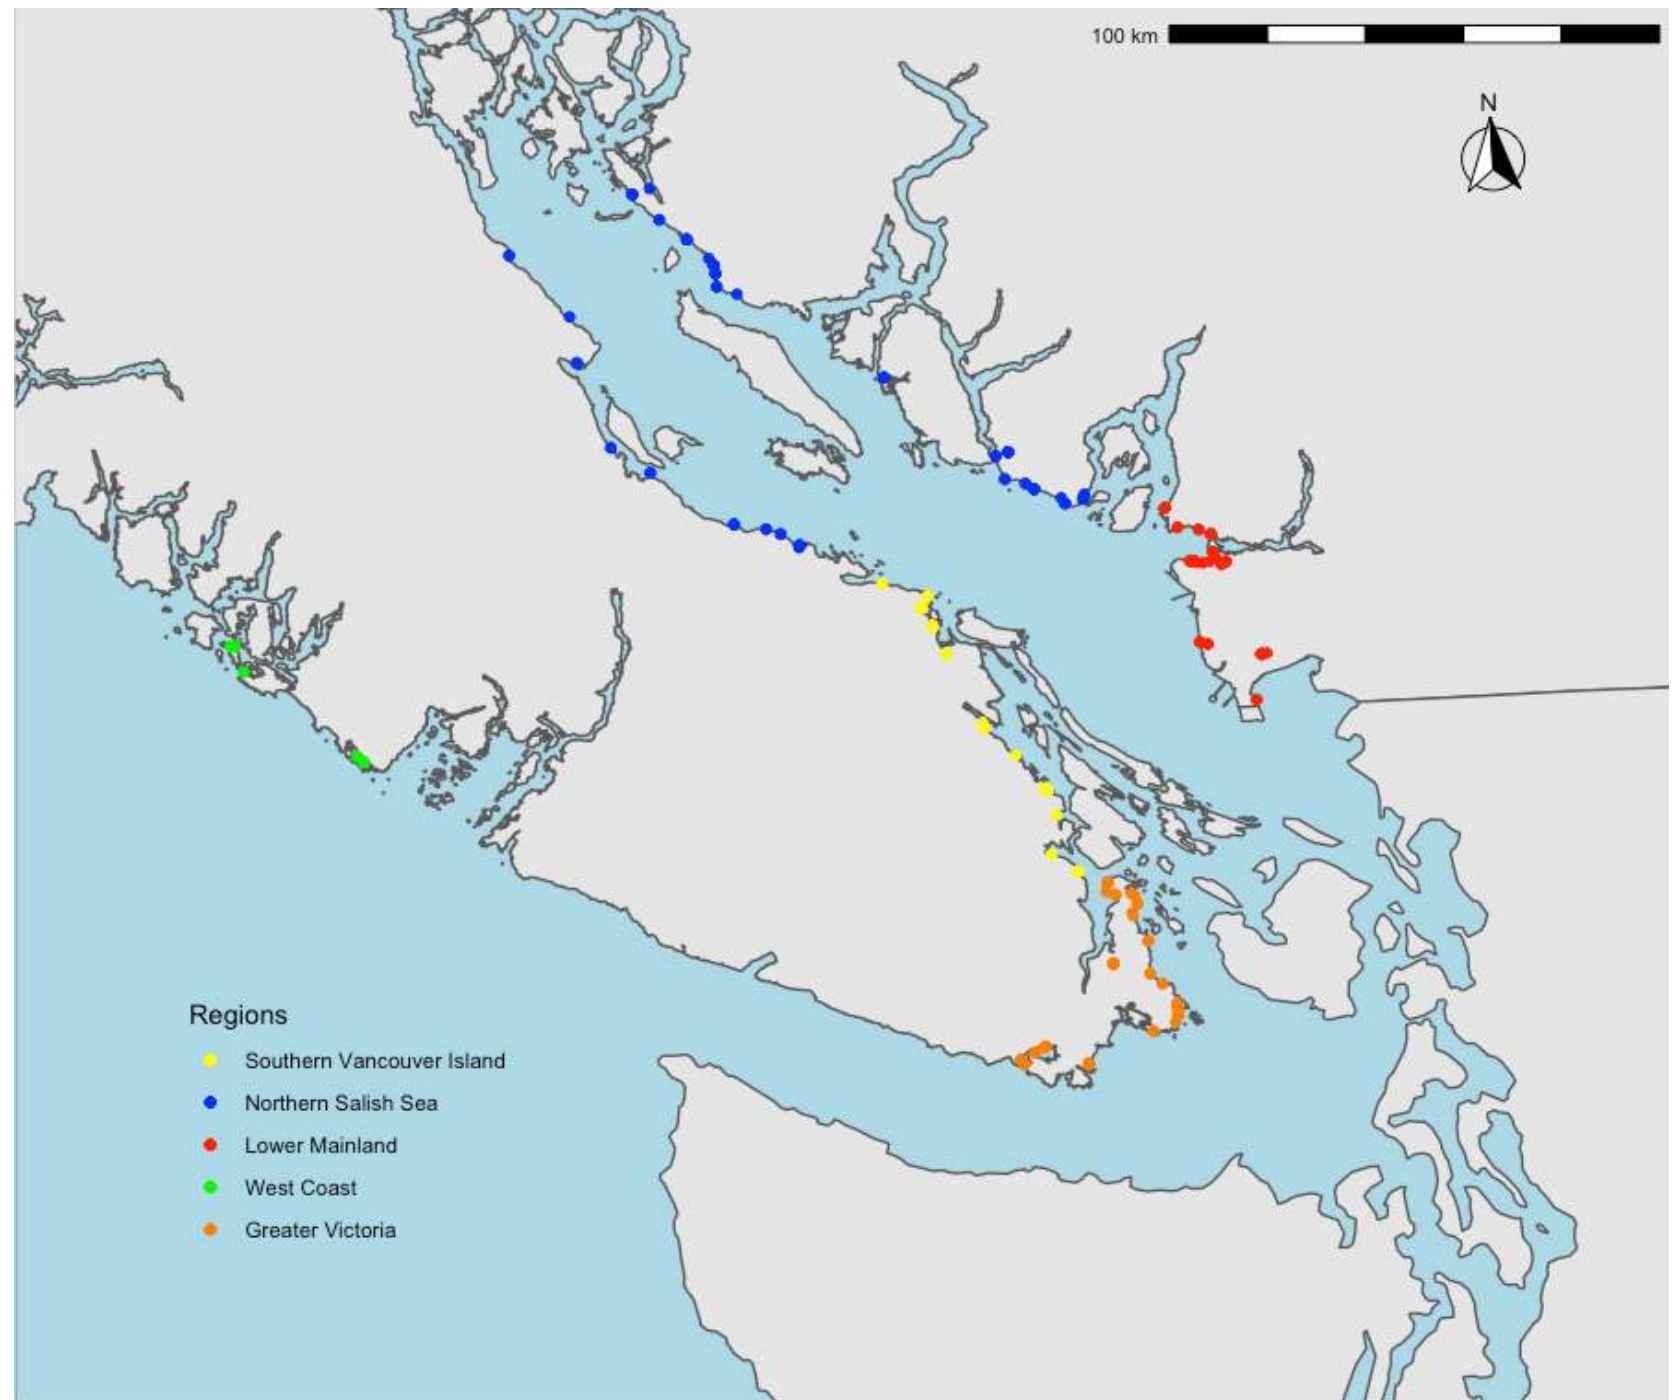

Capture locations

- Sampled throughout Canadian portion of the Salish Sea
- Captured 202 adult gulls
- 10 gulls sampled from west coast of Vancouver Island
- Varying levels of urban development and human density
- Habitats:
 - Natural
 - Urban
 - Landfills

Canadian census subdivision data obtained from Statistics Canada (2016)

Does
health

type?

Physiological baselines

| Indicator of health: | Trait | <i>n</i> = | Mean ± Standard Deviation |
|--------------------------------------|--|------------|---------------------------|
| “Nutritional state/energy stores” | Triglycerides (g/mmol) | 156 | 1.2 ± 0.8 |
| | Glucose (g/mmol) | 152 | 14.9 ± 3.5 |
| “Aerobic capacity” | Hemoglobin (g/dL) | 124 | 15.91 ± 2.49 |
| | Hematocrit (%) | 140 | 46.4 ± 4.4 |
| “Oxidative stress and muscle damage” | OXY (μmol HClO /mL) | 139 | 242 ± 34 |
| | dROMs (mg H ₂ O ₂ /dL) | 150 | 2.38 ± 1.5 |

Physiological baselines

| Indicator of health: | Trait | <i>n</i> = | Mean ± Standard Deviation |
|--------------------------------------|--|------------|---------------------------|

| | dROMs (mg H ₂ O ₂ /dL) | 150 | 2.38 ± 1.5 |

Correlation of physiological traits

| Comparison | <i>r</i> | P value |
|--------------------------|----------|---------|
| Triglycerides vs Glucose | 0.206 | 0.013 |
| Hemoglobin vs Hematocrit | 0.292 | 0.0009 |
| OXY vs dROMs | 0.198 | 0.022 |
| Triglycerides vs dROMs | 0.246 | 0.002 |
| Hematocrit vs Glucose | -0.287 | 0.0005 |
| Hematocrit vs dROMs | 0.282 | 0.0007 |

All other comparisons were non-significant ($P > 0.18$ in all cases).

Correlation of physiological traits

| Comparison | <i>r</i> | P value |
|--------------------------|----------|---------|
| Triglycerides vs Glucose | 0.206 | 0.013 |
| Hemoglobin vs Hematocrit | 0.292 | 0.0009 |
| OXY vs dROMs | 0.198 | 0.022 |
| Triglycerides vs dROMs | 0.246 | 0.002 |
| Hematocrit vs Glucose | -0.287 | 0.0005 |
| Hematocrit vs dROMs | 0.282 | 0.0007 |

All other comparisons were non-significant ($P > 0.18$ in all cases).

Correlation of physiological traits

|--------------------------|----------|---------|
| Triglycerides vs Glucose | 0.206 | 0.013 |
| Hemoglobin vs Hematocrit | 0.292 | 0.0009 |
| OXY vs dROMs | 0.198 | 0.022 |
| Triglycerides vs dROMs | 0.246 | 0.002 |
| Hematocrit vs Glucose | -0.287 | 0.0005 |
| Hematocrit vs dROMs | 0.282 | 0.0007 |

All other comparisons were non-significant ($P > 0.18$ in all cases).

Models and covariates

- ANOVAs used to test if traits vary with region or habitat type
- Sex bias: Females > Males ($X^2 = 28.6$; $DF = 1$; $P < 0.00000001$)
- AICc used to select covariates
 - Sex and/or mass
- Covariates included:
 - Triglycerides = sex
 - Hemoglobin = sex*mass
 - dROMs = triglycerides
- Year included as a random effect

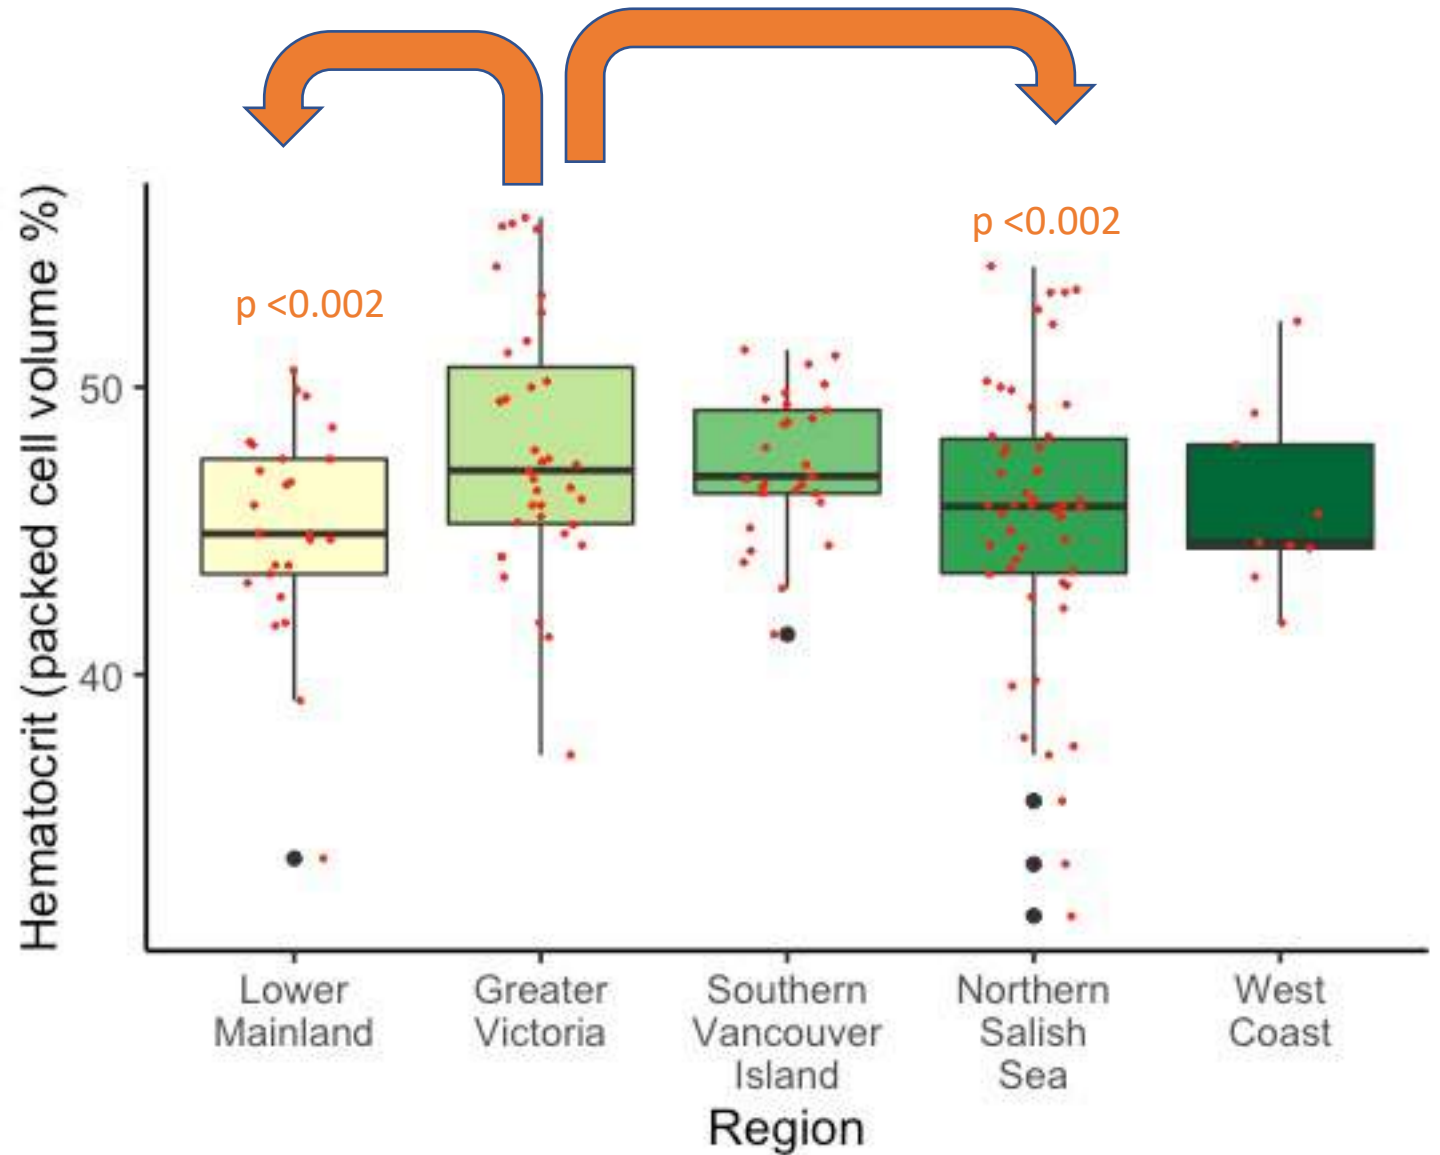

Photo: Anneka Vanderpas

Health by region

Hematocrit \sim region + (1|year)

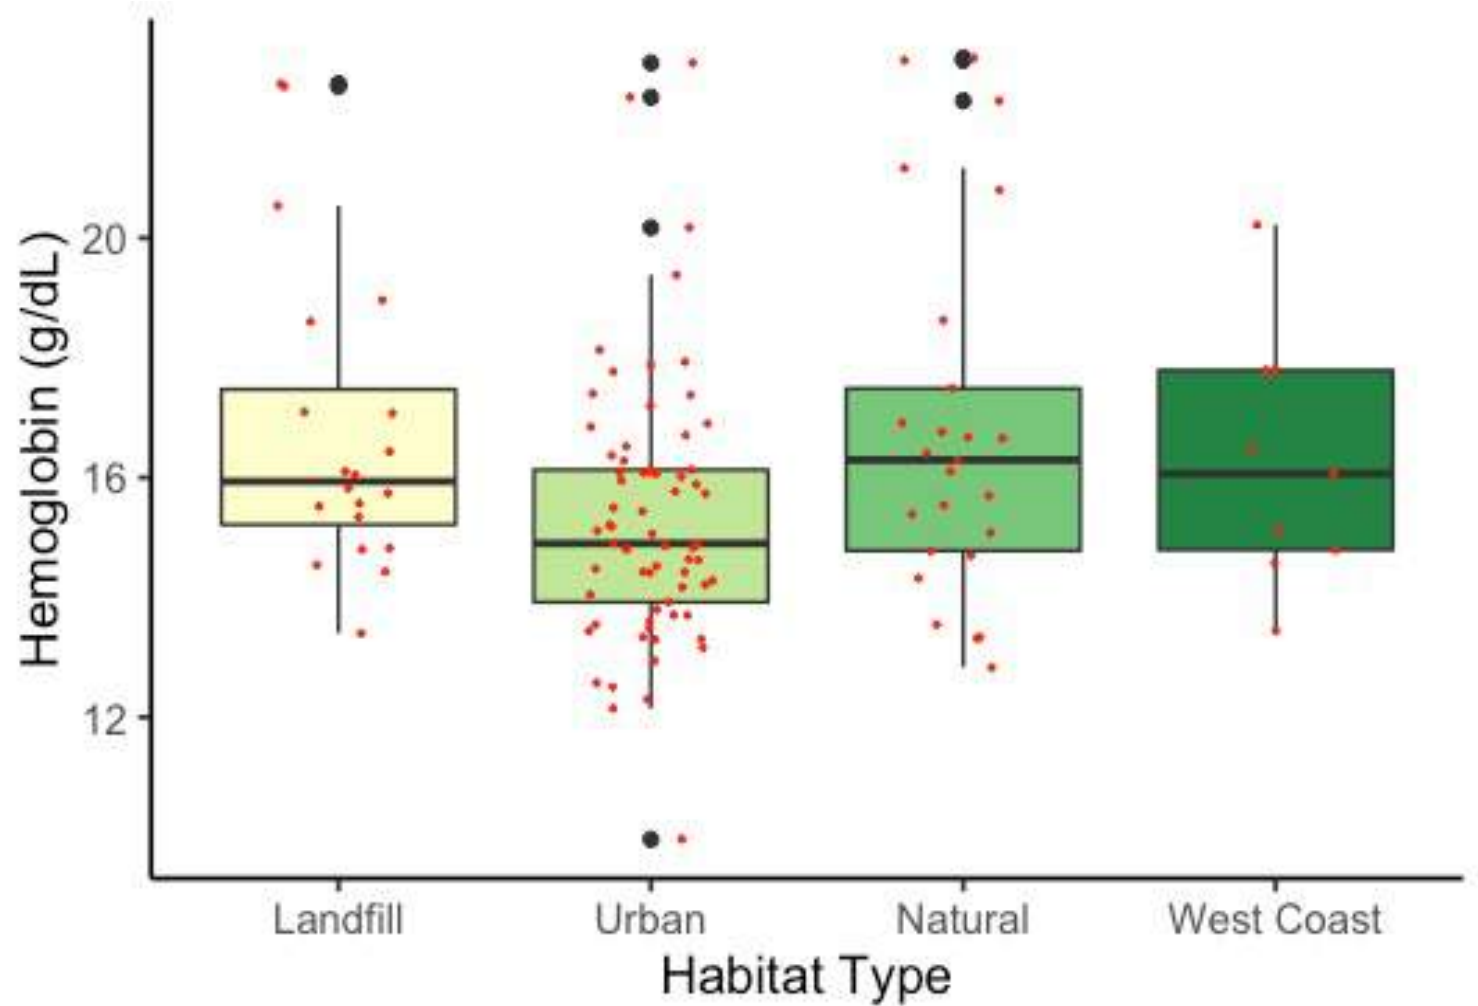

- $F_{4,142} = 5.4$
- $P = 0.0005$

Health by habitat type

Hemoglobin varied significantly by habitat type

- $F_3 = 3.68$
- $P = 0.01$
- No pairwise comparisons were significant.

“Overall health” using principle components analysis

| Trait | PC1 | PC2 |
|---------------|--------------|--------|
| Triglycerides | 0.177 | 0.655 |
| Glucose | -0.177 | 0.432 |
| Hemoglobin | 0.438 | -0.199 |
| Hematocrit | 0.501 | -0.436 |
| OXY | 0.393 | 0.302 |
| dROMs | 0.583 | 0.253 |

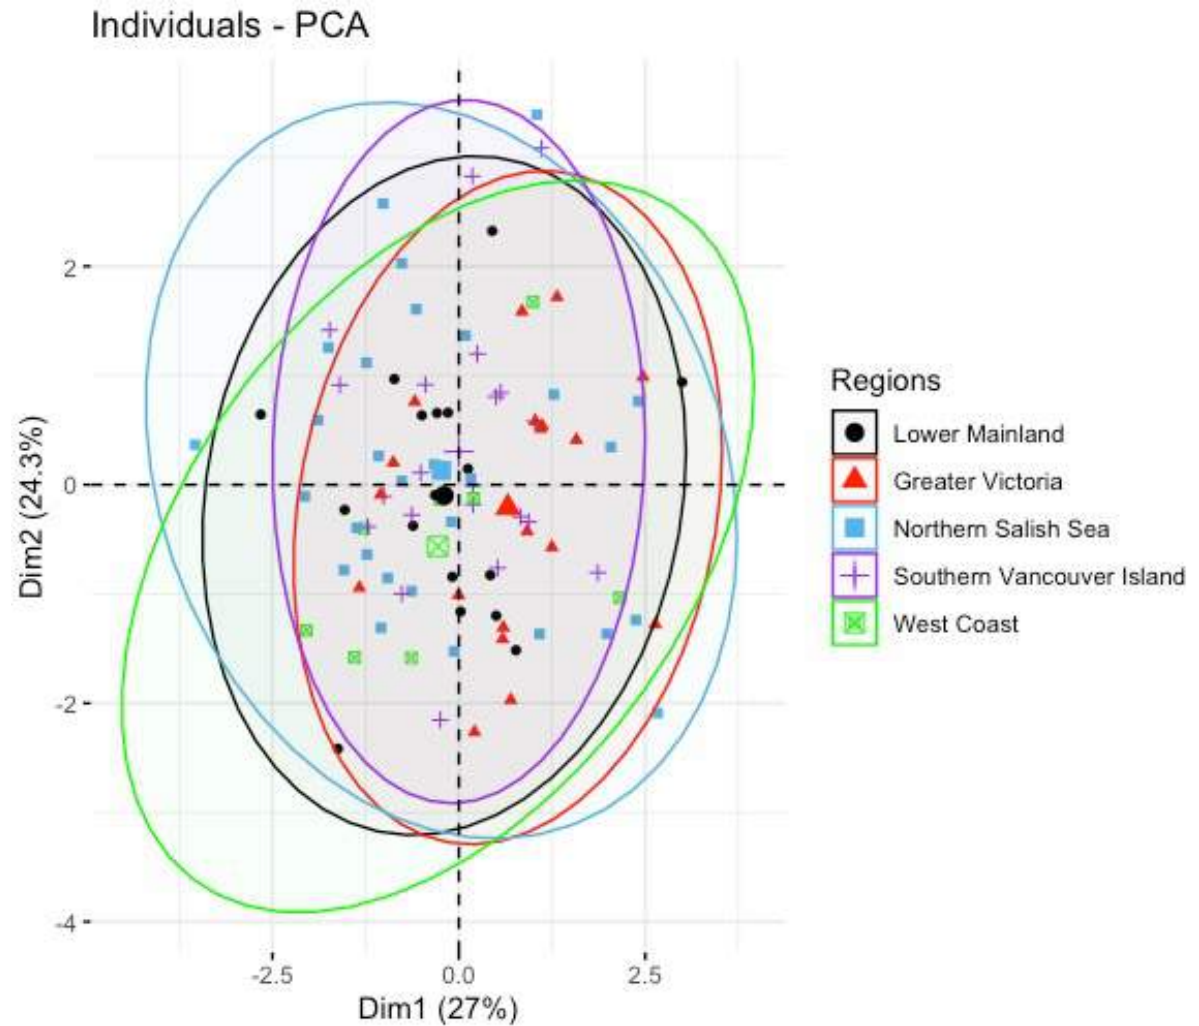

- PC1:
 - Strong positive effect of aerobic capacity
 - OXY + dROMs both positive
 - Potentially represents “good health”

“Overall health” using principle components analysis

| Trait | PC1 | PC2 |
|---------------|--------|--------------|
| Triglycerides | 0.177 | 0.655 |
| Glucose | -0.177 | 0.432 |
| Hemoglobin | 0.438 | -0.199 |
| Hematocrit | 0.501 | -0.436 |
| OXY | 0.393 | 0.302 |
| dROMs | 0.583 | 0.253 |

- PC2:
 - Triglycerides and glucose have strong positive influence
 - Negative influence of aerobic capacity
 - Potentially representative of “nutritional or energy status”

Health did not cluster by region or habitat

Conclusions

- Baseline reference physiology values provide a foundation for long-term monitoring.
- Traits were geographically comparable, even with the west coast.
- Sex is an important factor to consider.
- “Overall health” = relationship among traits, but no obvious clustering by region or habitat.
- Future analysis of diet, contaminant, and habitat data will provide further insight into health and use of GWGU as a bioindicator.
