Acknowledgments

The plankton samples used to create images for this manual were collected as part of the Lake Whatcom monitoring project, the Judy Reservoir monitoring project, the Lake Samish monitoring project, and the Northwest Lakes monitoring project. I would like to thank IWS staff Joan Vandersypen, Mike Hilles, and Marilyn Desmul, as well as the many undergraduate and graduate students who have helped with these projects. I am particularly grateful to the students in ESCI 428 (Freshwater Algae Bioindicators) who provided samples from every conceivable wet spot in Whatcom County.

Earlier sections of this manual were graciously reviewed by Karl Bruun, Nostoca Algae Laboratory, and Dr. Gary E. Dillard, Professor Emeritus of Biology, Western Kentucky University. Additional taxonomic advice was provided by Dr. Dean Blinn, Dr. Ronald Hoham, Dr. Jason Oyadomari, and Dr. Robert Sheath.

Special thanks go to my daughters Elizabeth, who patiently helped me write a computer program that made the biovolume calculations easier and more accurate, and Guinevere, who shares my love of pond scum. Finally, I want to thank my husband Geoffrey, who has written numerous custom software programs that made this book possible, and is always willing to scrape a rock or wade out to get one more sample that is just beyond my reach!
